The flow converter with the RS485 interface card fitted, is able to communicate with an external device (PC or other suitable computer system) using the Modbus protocol. This option allows data exchange between PC or computer and single or multiple devices.

The bus configuration consists of one external device as a master and one or more converters as slaves. For bus operation the device address (menu C5.8.1), baudrate (menu C5.8.2) and settings (menu C5.8.3, C5.8.4, C5.8.5 & C5.8.6) must be set in the converter.

All devices connected to the bus, must have different unique addresses but the same baud rate and settings.

## 2.1 General technical data

|                             |   |
|-----------------------------|---|
| Interface                   | RS485, galvanically isolated  |
| Baud rate                   | 1200, 2400, 3600, 4800, 9600, 19200, 38400, 57600 or 115200                                 |
| Protocol                    | Modbus RTU (available as a separate document on request)                                    |
| Maximum participants on bus | 32 per line, master included (may be extended by repeaters)                                 |
| Coding                      | NRZ bit coding  |
| Address range               | Modbus: 1...247   |
| Transmission procedure      | Half duplex, asynchronous   |
| Bus access                  | Master / slave  |
| Cable                       | Shielded twisted pair for RS 485 applications   |
| Distances                   | Maximum 1.2 km / 3937 ft without repeater (dependant on baud rate and cable specifications) |

## 2.2 Technical data of the Modbus interface (acc. to EIA standards)

|   |                                   |
|---|-----------------------------------|
| Kind of signal transmission   | Differential, 2-wire topology     |
| Maximum number of transmitter/receivers   | 32                                |
| Voltage range on converter input  | -7...+12 V                        |
| Maximum voltage on converter output   | 5 V                               |
| Minimum voltage on driver output, max. load                                     | $U_{\text{diff}} > 1.5 \text{ V}$ |
| Maximum input current (off state)   | -20...+20 $\mu\text{A}$           |
| Receiver input voltage  | -7...+12 V                        |
| Sensitivity of the receiver   | -200...+200 mV                    |
| Receiver input resistance   | > 12 k $\Omega$                   |
| Short circuit current   | < 250 mA                          |
| Termination / polarization resistors (refer to chapter "Electrical connection") | 120 $\Omega$ / 560 $\Omega$       |

For proper operation of Modbus in half duplex mode in single or multi-drop communication, it is recommended that a termination resistor is applied to both ends of the data line. The simplest form of termination is line-to-line resistor across the differential input.

In RTU mode the Modbus protocol requires quiet periods on the communications bus for synchronisation. It is therefore important that the Modbus is not allowed to "float", i.e. unreferenced to 0 V, as this could lead to spurious signals due to noise pick-up. It is therefore necessary to employ biasing resistors at one point on the bus network, normally the "end".

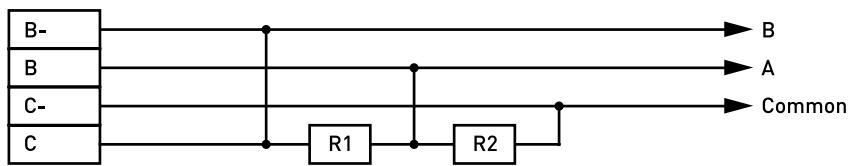

| Converter Fct. No. | Display            | Description and settings   |
|--------------------|--------------------|--|
| C5.8.1             | Slave Address      | Selects the Modbus address of the device.<br>Range: 1..247 (default = 1)   |
| C5.8.2             | Baud Rate          | Selects the baud rate of the device.<br>Options:<br>1200 / 2400 / 3600 / 4800 / 9600 / 19200 (default) / 38400 / 57600 / 115200              |
| C5.8.3             | Parity             | Selects the parity.<br>Options:<br>Even (default) / Odd / No   |
| C5.8.4             | Data Format        | Selects the data format.<br>Options:<br>Big Endian (default) / Little Endian   |
| C5.8.5             | Transmission Delay | Selects the delay between receiving the last byte of a request and sending the first byte of the response.<br>Range: 0..40ms (default = 0ms) |
| C5.8.6             | Stop Bits          | Selects the number of stop bits.<br>Options:<br>1 (default) / 2  |
| C5.8.7             | Information        | Displays information about the device.   |

Refer to the standard handbook of the converter for connection details.

#### Modbus connections

| Terminals | Description    |
|-----------|----------------|
| B-        | Signal B (D 1) |
| B         | Signal A (D 0) |
| C-        | Common 0 V     |
| C         | 3.3 V; 560 Ω   |
| D-        | Pulse output - |
| D         | Pulse output + |

#### Example for bus termination

R1: 120 Ω

R2: 560 Ω

## 6.1 General information concerning the protocol

Using RTU (Remote Terminal Unit) format, data is transmitted as 8 bit binary characters. There are no special characters to determine the start and end of a message frame.

Synchronisation is achieved by a minimum silent period of at least 3.5 character times before the start of each frame transmission and a maximum silent period of 1.5 character times between characters in the same frame.

## 6.2 RTU frame format

The format of the query and response frames vary slightly depending upon the command function. The basic form is outlined below.

| Command function                                   | Frame format                       | Description  |
|--|------------------------------------|--|
| Silent period                                      | 3.5 x T                            | All transmissions must be preceded by a minimum silent period of 3.5 x T, where T is the transmission time of a single character. This can be calculated from the baud rate, e.g. at 19.2 kb no parity with 1 stop bit (10 bits), T = 520 µs.  |
| Slave address                                      | 8 bits                             | This is a single byte slave address which is transmitted first and must be in the range of 1...247. Address 0 is reserved for a broadcast address which all slaves should recognise, and therefore requires no response.   |
| Function code                                      | 8 bits                             | This is an eight bit code in the range of 1...255 although only 126 functions exist as the codes 129...255 represent an error condition. An error condition occurs when the addressed slave does not accept the command, in which case it responds with the function code + 128, i.e. with its MSB set to 1.   |
| Register start address or byte count when required | 8 bit byte count<br>16 bit address | <p><b>Register start address:</b> for a query command that requires data to be returned, this field will contain the 16 bit start address of the register (or data) to be returned.<br/>           Note that the signal converter uses protocol addresses. Therefore the register address listed is the actual number required in the Modbus command.</p> <p><b>E.g.:</b> to access input register 30006, the register start address is 30006dec = 7536hex.</p> <p><b>Byte count:</b> In general this is only present in frames that are transferring data, and has a value equal to the number of bytes contained in the data field. The data field is limited to a maximum of 250 bytes.</p> |
| Number of points or data bytes when required       | n × 8 bits                         | <p><b>Number of points:</b> for a query command that requires data to be returned, this field will contain the number of registers to be returned regardless of their bit size.</p> <p><b>Data bytes:</b> contains the data requested. The signal converter can use Big Endian format (MSB first) or Little Endian format (LSB first).</p>   |
| CRC  | 16 bits                            | This field contains a 16 bit CRC which is calculated on all the data bits of the message bytes.  |

## 6.3 Addressing

In the following tables the Modbus protocol addresses / data addresses are listed.

Some systems cannot use addresses above 9999. For these systems there is the possibility to use the listed addresses but

- for Input Registers omit the leading 3 of 3xxxx;
- for Holding Registers omit the leading 4 of 4xxxx;
- for Input Registers replace the leading 20 of 20xxx by 9xxx.

Sometimes register numbers are asked for. The **register numbers** can be calculated by adding a 1 to the protocol address and using a prefix according to the block:

- prefix 1 for coils
- prefix 3 for Input Registers
- prefix 4 for Holding Registers

## 6.4 Overview of supported functions

The following table shows Modbus functions supported by RS485 interface.

| Function code |     | Name                             | Access to   |
|---------------|-----|----------------------------------|---|
| hex           | dec |                                  |   |
| 01            | 01  | Read Single Coil                 | Status of calibration functions, counter status (start/stop)                        |
| 03            | 03  | Read Holding Register            | Acyclic Registers<br>Signal converter configuration parameter                       |
| 04            | 04  | Read Input Register              | Cyclic Register<br>Measurement values, status values and calibration results        |
| 05            | 05  | Write Single Coil                | Cold start, warm start, error reset, start calibration function, start/stop counter |
| 08            | 08  | Diagnostics                      | -   |
| 10            | 16  | Write Multiple Register          | Acyclic Registers<br>Signal converter configuration parameter                       |
| 2B            | 43  | Encapsulated Interface Transport | Transparent Channel, Read Device Identification                                     |

## 6.5 Device identification on the Modbus interface

The device identification is according to the category "Regular" according to the Modbus Application Protocol Specification V1.1a. Function code 43 / 14 (0x2B / 0x0E).

| Modbus object Id | Object name / Description | Type                 | Content   |
|------------------|---------------------------|----------------------|---|
| 0x00             | VendorName                | 16 byte ASCII String | KROHNE  |
| 0x01             | ProductCode               | 10 byte ASCII String | CG number; order code for the converter assembly      |
| 0x02             | MajorMinorRevision        | 7 byte ASCII String  | V1.0.xx   |
| 0x03             | Vendor URL                | 32 byte ASCII String | www.krohne.com  |
| 0x04             | ProductName               | 16 byte ASCII String | IFC100  |
| 0x05             | ModelName                 | 16 byte ASCII String | Modbus  |
| 0x06             | UserApplicationName       | 16 byte ASCII String | User tag, displayed on the header of the local screen |

## 6.6 Coil registers

**These function codes are used for access:**

- 0x01 = read input coil
- 0x05 = write single coil

### 6.6.1 Converter controls

| Coil address | Function   |
|--------------|--|
| 1000         | Write 1 generates a cold start, write 0 is ignored   |
| 1001         | Write 1 generates a warm start, write 0 is ignored   |
| 1002         | Write 1 generates an error reset, write 0 is ignored |

### 6.6.2 Counter controls

| Modbus protocol address | Description            | Settings |   |                    | Converter Fct. No. |
|-------------------------|------------------------|----------|---|--------------------|--------------------|
| 3000                    | Start / Stop Counter 1 | Write    | 1 | start counter      | C3.1.8 / C3.1.9    |
|                         |                        | Write    | 0 | stop counter       |                    |
|                         |                        | Read     | 1 | counter is running |                    |
|                         |                        | Read     | 0 | counter is stopped |                    |
| 3001                    | Start / Stop Counter 2 | Write    | 1 | start counter      | C3.2.8 / C3.2.9    |
|                         |                        | Write    | 0 | stop counter       |                    |
|                         |                        | Read     | 1 | counter is running |                    |
|                         |                        | Read     | 0 | counter is stopped |                    |
| 3002                    | no function            |          |   |                    |                    |
| 3003                    | Reset Counter 1        | Write    | 1 | reset counter      | C3.1.6             |
|                         |                        | Write    | 0 | -                  |                    |
|                         |                        | Read     | 0 | -                  |                    |
| 3004                    | Reset Counter 2        | Write    | 1 | reset counter      | C3.2.6             |
|                         |                        | Write    | 0 | -                  |                    |
|                         |                        | Read     | 0 | -                  |                    |
| 3005                    | no function            |          |   |                    |                    |

### 6.6.3 Start calibration functions

| Modbus protocol address | Description                  | Settings |   |                | Converter Fct. No. |
|-------------------------|------------------------------|----------|---|----------------|--------------------|
| 2000                    | Zero Calibration             | Write    | 1 | start function | C1.1.1             |
|                         |                              | Write    | 0 | -              |                    |
|                         |                              | Read     | 0 | -              |                    |
| 2001                    | Coil Temperature Calibration | Write    | 1 | start function | C1.1.8             |
|                         |                              | Write    | 0 | -              |                    |
|                         |                              | Read     | 0 | -              |                    |
| 2002                    | Electrode Factor Calibration | Write    | 1 | start function | C1.1.11            |
|                         |                              | Write    | 0 | -              |                    |
|                         |                              | Read     | 0 | -              |                    |

## 6.7 Input registers

All input registers in the Modbus protocol address range from 30000 to 38998 are mapped into the range 0 to 8998. All input registers in the Modbus protocol address range from 20000 to 20998 are mapped into the range 9000 to 9998. This is done to give systems with restriction on the address range access to the device.

Measurement and status values are read only and can be accessed as Modbus "Input Registers". Cyclic GDC objects are mapped to Modbus Registers.

Function code is 04 (0x04).

| Modbus protocol address |     | Description and settings   | Type         | Number of registers |
|-------------------------|-----|--|--------------|---------------------|
| 1st                     | 2nd |  |              |                     |
| 30000                   | 0   | <b>flow speed</b> [m/s]  | float        | 2                   |
| 30002                   | 2   | <b>volume flow</b> [m <sup>3</sup> /s]   | float        | 2                   |
| 30004                   | 4   | <b>mass flow</b> [kg/s]  | float        | 2                   |
| 30006                   | 6   | <b>coil temperature</b> [K]  | float        | 2                   |
| 30008                   | 8   | <b>conductivity</b> [S/m]<br>This value may not be measured.<br>Depending on register (4)2003.<br>0 = off (not measured)<br>1 = conductivity [S/m]<br>2 = cond. + empty pipe (S) [S/m]<br>3 = cond. + empty pipe (F) [S/m]<br>4 = cond. + empty pipe (I) [S/m] | float        | 2                   |

| 30014                   | 14  | <b>Display Channel 2</b><br>Represents the value on the first line of the second measurement screen in SI units  | float        | 2                   |
| 30016                   | 16  | <b>Operating time</b> [s]  | float        | 2                   |
| 30018                   | 18  | Not used, returns zero   | float        | 2                   |
| 30020                   | 20  | <b>Counter 1</b> [m <sup>3</sup> ] or [kg]   | double float | 4                   |
| 30024                   | 24  | <b>Counter 2</b> [m <sup>3</sup> ] or [kg]   | double float | 4                   |
| 30028                   | 28  | Not used, returns zero   | double float | 4                   |
| 30032                   | 32  | <b>long status sensor</b>  | byte [4]     | 2                   |
| 30034                   | 34  | <b>long status device</b>  | byte [4]     | 2                   |

Input register 30018 is not used up to now. This is included to fill the gap between the float and double float values and allows to read the full range of registers.

Also the result of a calibration procedure is accessed by an input register at Modbus Protocol Address 20000 or 9000. The type are one or more float values. This is depending on the used function (refer to "Calibration procedures").

| Modbus protocol address |      | Description and settings         | Type                     | Number of registers      |
|-------------------------|------|----------------------------------|--------------------------|--------------------------|
| 1st                     | 2nd  |                                  |                          |                          |
| 20000                   | 9000 | Result of a calibration function | one or more float values | 2 times number of values |

## 6.8 Holding registers

All holding registers in the Modbus protocol address range from 40000 to 49998 are mapped into the range 0 to 9998. This is done to give systems with restriction on the address range access to the device.

Some parameters of the device can be accessed as Modbus "holding registers".

Function code 03 (0x03) for "Read" operations and function code 16 (0x10) for "Write" operations.

The holding registers are grouped into the following different sections.

### 6.8.1 Counter parameters

| Modbus protocol address |      | Description and settings  | Converter Fct. No. | Type  | Number of registers |
|-------------------------|------|---|--------------------|-------|---------------------|
| 1st                     | 2nd  |   |                    |       |                     |
| 40000                   | 0    | <b>counter 1 function</b><br>1 = sum counter<br>2 = + counter<br>3 = - counter<br>0 = off | C3.1.1             | byte  | 1                   |
| 40001                   | 1    | <b>measurement Cnt1</b><br>21 = volume flow<br>22 = mass flow                             | C3.1.2             | word  | 1                   |
| 40002                   | 2    | <b>counter 2 function</b><br>1 = sum counter<br>2 = + counter<br>3 = - counter<br>0 = off | C3.2.1             | byte  | 1                   |
| 40003                   | 3    | <b>measurement Cnt2</b><br>21 = volume flow<br>22 = mass flow                             | C3.2.2             | word  | 1                   |
| 40004                   | 4    | no function   |                    | byte  | 1                   |
| 40005                   | 5    | no function   |                    | word  | 1                   |
| 41000                   | 1000 | <b>low flow cutoff value Cnt1 [m<sup>3</sup>/s] or [kg/s]</b>                             | C3.1.3             | float | 2                   |
| 41002                   | 1002 | <b>time constant Cnt1 [s]</b>   | C3.1.4             | float | 2                   |
| 41004                   | 1004 | <b>set counter Cnt1 or read Cnt1 [m<sup>3</sup>] or [kg]</b>                              | C3.1.7             | float | 2                   |
| 41006                   | 1006 | <b>low flow cutoff value Cnt2 [m<sup>3</sup>/s] or [kg/s]</b>                             | C3.2.3             | float | 2                   |
| 41008                   | 1008 | <b>time constant Cnt2 [s]</b>   | C3.2.4             | float | 2                   |

| Modbus protocol address |      | Description and settings                                     | Converter Fct. No. | Type  | Number of registers |
|-------------------------|------|--|--------------------|-------|---------------------|
| 1st                     | 2nd  |  |                    |       |                     |
| 41010                   | 1010 | <b>set counter Cnt2 or read Cnt2 [m<sup>3</sup>] or [kg]</b> | C3.2.7             | float | 2                   |
| 41012                   | 1012 | no function  |                    | float | 2                   |
| 41014                   | 1014 | no function  |                    | float | 2                   |
| 41016                   | 1016 | no function  |                    | float | 2                   |
| 41018                   | 1018 | <b>preset counter 1 [m<sup>3</sup>] or [kg]</b>              | C3.1.5             | float | 2                   |
| 41020                   | 1020 | <b>preset counter 2 [m<sup>3</sup>] or [kg]</b>              | C3.2.5             | float | 2                   |
| 41022                   | 1022 | no function  |                    | float | 2                   |

### 6.8.2 Process input filter and self test parameters

| Modbus protocol address |      | Description and settings   | Converter Fct. No. | Type  | Number of registers |
|-------------------------|------|--|--------------------|-------|---------------------|
| 1st                     | 2nd  |  |                    |       |                     |

### 6.8.3 Modbus parameters

| Modbus protocol address | Description and settings   | Converter Fct. No. | Type  | Number of registers |
|-------------------------|--|--------------------|-------|---------------------|
| 50000                   | <b>baud rate</b><br>1200 / 2400 / 3600 / 4800 / 9600 / 19200<br>(default) / 38400 / 57600 / 115200 | C5.8.2             | ulong | 2                   |
| 50002                   | <b>slave address</b>   | C5.8.1             | byte  | 1                   |
| 50003                   | <b>parity</b><br>0 = even parity (default)<br>1 = odd parity<br>3 = no parity                      | C5.8.3             | byte  | 1                   |
| 50004                   | <b>data format</b><br>1 = Big Endian<br>2 = Little Endian  | C5.8.4             | byte  | 1                   |

### 6.9 Diagnostics

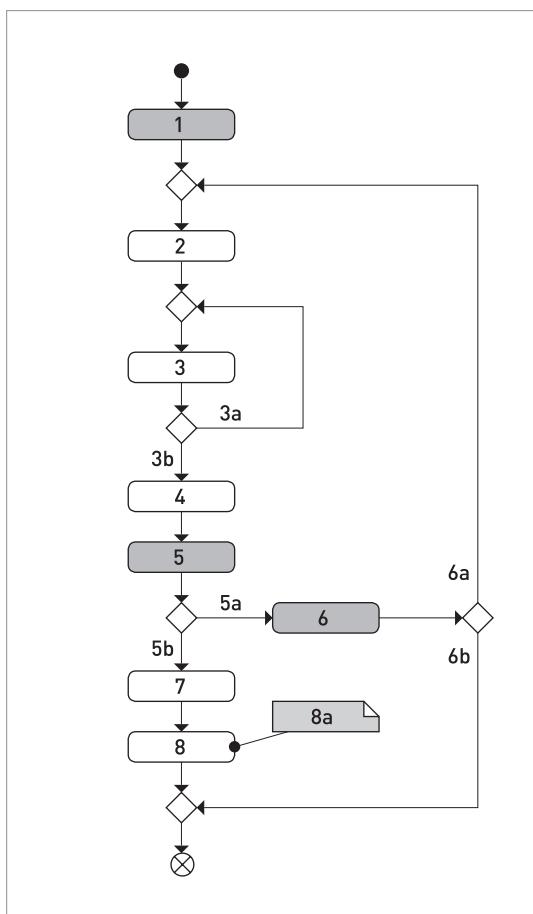

The Modbus interface supports the diagnostic function defined by the "Modbus Application Protocol Specification".

Function code is 08 (0x08).

| Sub function code |     | Name                                       |
|-------------------|-----|--|
| hex               | dec |  |
| 00                | 00  | Return Query Data                          |
| 01                | 01  | Restart Communication Option               |
| 04                | 04  | Force Listen Only Mode                     |
| 0A                | 10  | Clear Counters                             |
| 0B                | 11  | Return Bus Message Count                   |
| 0C                | 12  | Return Bus Communication Error Count       |
| 0D                | 13  | Return Bus Exception Count                 |

## 6.10 Calibration procedures

### 6.10.1 Zero Flow Calibration

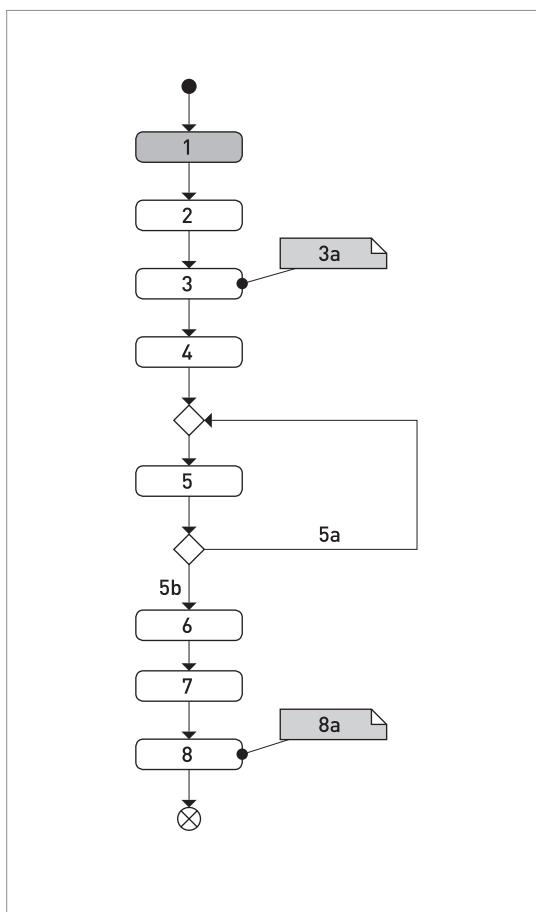

- 1 **User reduces the actual flow through the meter to zero**
- 2 **Start zero calibration:**  
Set single coil 2000 to 1 (Modbus Fct. 0x05)
- 3 **Check status of calibration**  
Read single coil 2000 (Modbus Fct. 0x01)  
[2000 == 1: calibration running]  
[2000 == 0: calibration complete]
- 3a
- 3b
- 4 **Read Calibration Value**  
Read Input Register 20000 type float (Modbus Fct. 0x04)
- 5 **User checks the calibration value:**  
-0.01...+0.01: good results  
-0.1...+0.1: acceptable result for difficult application
- 5a Not ok
- 5b ok
- 6 **User tries to improve the calibration situation**  
Improvement done
- 6a Improvement not possible  
-Break-
- 6b
- 7 **Write the calibration value**  
Write Holding Register 43024 type float (Modbus Fct. 0x10)
- 8 **Activate new values**  
Set single coil 1001 to 1 (Modbus Fct. 0x05)
- 8a This results in a warm start of the device.  
Will take maximum 5s.

### 6.10.2 Coil Temperature Calibration

- 1 **Read actual Rsp,20**  
Read Holding Register 43026 type float  
(Modbus Fct. 0x03)
- 2 User checks the value with the calibration value  
on the type plate of the device
- 2a Rsp,20 not correct
- 2b **Write correct Rsp,20**  
Write Holding Register 43026 type float  
(Modbus Fct. 0x10)
- 2c Rsp,20 correct or corrected
- 3 **User enters the actual coil temperature in K**  
This is the target for the calibration
- 4 **Write actual coil temperature**  
Write Holding Register 43028 type float  
(Modbus Fct. 0x10)
- 5 **Start coil temperature calibration:**  
Set single coil 2001 to 1 (Modbus Fct. 0x05)
- 6 **Check status of calibration:**  
Read single coil 2001 (Modbus Fct. 0x01)
- 6a [2001 == 1: calibration running]
- 6b [2001 == 0: calibration complete]
- 7 **Read Calibration Value**  
Read Input Register 20000 type float  
(Modbus Fct. 0x04)
- 8 **Write the calibration value**  
Write Holding Register 43030 type float  
(Modbus Fct. 0x10)
- 9 **Activate new values**  
Set single coil 1001 to 1 (Modbus Fct. 0x05)
- 9a This results in a warm start of the device.  
Will take maximum 5s.

### 6.10.3 Conductivity Calibration

- 1 **User enters the actual conductivity in S/m**  
This is the target for the calibration
- 2 **Write actual conductivity**  
Write Holding Register 43034 type float  
(Modbus Fct. 0x10)
- 3 **Write actual conductivity**  
Write Holding Register 43036 type float  
(Modbus Fct. 0x10)
- 3a The target value has to be written to both registers!
- 4 **Start conductivity calibration:**  
Set single coil 2002 to 1 (Modbus Fct. 0x05)
- 5 **Check status of calibration:**  
Read single coil 2002 (Modbus Fct. 0x01)  
[2002 == 1: calibration running]  
[2002 == 0: calibration complete]
- 5a
- 6 **Read Calibration Value**  
Read Input Register 20000 type float  
(Modbus Fct. 0x04)
- 7 **Write the calibration value**  
Write Holding Register 43032 type float  
(Modbus Fct. 0x10)
- 8 **Activate new values**  
Set single coil 1001 to 1 (Modbus Fct. 0x05)
- 8a This results in a warm start of the device.  
Will take maximum 5s.

## KROHNE product overview

- Electromagnetic flowmeters
- Variable area flowmeters
- Ultrasonic flowmeters
- Mass flowmeters
- Vortex flowmeters
- Flow controllers
- Level meters
- Temperature assemblies
- Pressure transmitters
- Analysis products
- Products and systems for the oil & gas industry
- Measuring systems for the marine industry

Head Office KROHNE Messtechnik GmbH  
Ludwig-Krohne-Str. 5  
47058 Duisburg (Germany)
