7 Notes .................................................................................. 30
1.1 General notes

This additional instruction applies to explosion-protected versions of vortex flowmeters with protection type flameproof enclosure “d”, increased safety “e” and equipment dust-ignition protection through enclosure “t”, equipment category II 2 G and II 2 D, EPL Gb and EPL Db. It completes the standard manual for the non-explosion protected versions.

The information given in this instruction contains only the data relevant to explosion protection of category 2. The technical details given in the manual for the non-explosion protected versions remain unchanged unless they will be excluded or replaced by this instruction.

1.2 EU conformity

The manufacturer declares with the EU declaration of conformity on his own responsibility conformity with the protection goals of directive 2014/34/EU for use in hazardous areas with gas and dust.

The EU declaration of conformity for the equipment category II 2 G and II 2 D is based on the EU type examination certificate:

KIWA 14 ATEX 0016X

The “X” after the certificate number refers to special conditions for safe use of the device, which have been listed in these instructions.
If needed the EU type examination certificate can be downloaded from the manufacturer’s website.

1.3 Approval according to the IECEx scheme

The number of the IECEx certificate is:

IECEx KIWA 15.0021X

The “X” after the certificate number refers to special conditions for safe use of the device, which have been listed in these instructions.
If needed, the IEC certificate can be downloaded from the manufacturer’s website.
1.4 Safety instructions

If these instructions are not followed, there is a risk of explosion.

Assembly, installation, start-up and maintenance may only be performed by personnel trained in explosion protection!

CAUTION!
Operating conditions and place of installation may require compliance with additional standards, directives or laws. The responsibility for compliance rests solely with the operator or his agent.
2.1 Device description

Vortex flowmeters measure and display the flow of flammable and non-flammable gases and liquids. The signal converter includes either a 4...20 mA signal output with optional HART® communication or a bus connection. There are bus connections available according to the FISCO model for connecting to the Foundation Fieldbus or Profibus PA. Signal converters with signal output have a separate binary output and a separate current input.

2.2 Description code

The safety description code consists of the following elements*:

![Figure 2-1: Safety description code for the compact version](image)

- Product designation
- Type series
- Compact version
- Electrical signal output
  - Free - current output 4...20 mA with optional HART® communication
  - FF - Foundation Fieldbus bus connection
  - PA - Profibus PA bus connection
- Ex - explosion-protected version

![Figure 2-2: Safety description code for the signal converter of the remote version](image)

- Product designation
- Type series
- Remote version
- Electrical signal output
  - Free - current output 4...20 mA with optional HART® communication
  - FF - Foundation Fieldbus bus connection
  - PA - Profibus PA bus connection
- Sensor electronics VFC 020
- Ex - explosion-protected version
2.3 Marking

The marking of the devices in accordance with the description code is shown on the nameplates below. On both the compact devices and the remote versions, the main plate is located on the signal converter housing. On the remote versions there is an additional marking on the flow sensor.

Compact versions with two signal converters for dual measurement (dual version) are each marked with a nameplate, which is attached to each of the signal converter housings. The details relevant to explosion protection are identical on both nameplates.

![Figure 2-3: Safety description code for the flow sensor of the remote version](image)

* positions which are not needed are omitted (no blank positions)

The remote version consisting of the flow sensor OPTISWIRL 4000 F and the signal converter VFC 200 F 020 is called the OPTISWIRL 4200 F.

![Figure 2-4: Example of a nameplate for the compact version](image)
Figure 2-5: Example of nameplates for remote version

1. Device version VFC 200 F .. 020 / OPTISWIRL 4000 F
2. Production order number
3. Serial number
4. Year of manufacture
5. Marking according to KIWA 14 ATEX 0016X or IECEx KIWA 15.0021X
6. Permissible ambient temperature range
7. Electrical connection data
8. Safety instructions, disposal and data matrix
9. Internet address of the manufacturer
2.4 Flammable products

Atmospheric conditions
An explosive atmosphere is a mixture of air and flammable gases, vapours, mists or dusts under atmospheric conditions. It is defined by the following values: $T_{atm} = -20\ldots+60^\circ C \ / \ -4\ldots+140^\circ F$ and $P_{atm} = 0.8\ldots1.1$ bar / 11.6\ldots15.9 psi. Outside of this range, for most mixtures no key figures are available for the ignition behaviour.

Operating conditions
Vortex flowmeters operate outside of atmospheric conditions, which means that explosion protection according to the ATEX directive, regardless of the zone assignment, is fundamentally not applicable due to the lack of key safety data for the interior of the measuring section.

CAUTION!
Operation with flammable products is only permitted as long as no explosive fuel/air mixture builds up on the inside of the flowmeter under operating conditions. The operator is responsible to ensure that the flowmeter is operated safely in terms of the temperature and pressure of the products used. In case of operation with flammable products the measuring units must be included in the periodic pressure tests of the system.

2.5 Equipment category / EPL

Vortex flowmeters are designed in category II 2 G / II 2 D or EPL Gb and EPL Db according to EN 60079-0, EN 60079-1 and EN 60079-31 for use in zone 1 or zone 21. The inside of the measuring unit is also approved for zone 1.

Vortex flowmeters are designed according to the “IECEx-Scheme” according to “Equipment Protection Level [EPL] Gb or [EPL] Db”.

INFORMATION!
Definition of zone 1 according to EN 1127-1, Appendix B:
An area in which an explosive atmosphere, as a result of the mixture of flammable substances in the form of gas, steam or mist with air, under normal operation may occasionally occur.

Definition of zone 21 according to EN 1127-1, Appendix B:
An area in which an explosive atmosphere may occasionally occur in the form of a cloud of flammable dust in the air under normal operation.
2.6 Types of protection

The following types of protection are used:

<table>
<thead>
<tr>
<th>Device Type</th>
<th>Protection Type</th>

</table>
| Electronics compartment | II 2 D | Ex tb [ia] IIC T70°C Gb (signal converter)  
|                       |       | or Ex ia IIC T70°C...T240°C Db (flow sensor) |
| Terminal compartment     |       | Ex tb [ia] IIC T70°C Gb (signal converter)  
|                       |       | or Ex ia IIC T70°C...T240°C Db (flow sensor) |
2.7 Ambient temperature / temperature classes

Because of the influence of the temperature of the product, no fixed temperature class is assigned to vortex flowmeters. The temperature class of these devices is rather a function of the product temperature and ambient temperature that is present and the specific device version. The classification is outlined in the following tables.

The tables take into account the following parameters:
- Ambient temperature $T_{\text{amb}}$
- Product temperature $T_m$
- Nominal size DN
- Heat resistance of the connecting cable
**INFORMATION!**

The maximum permissible product temperatures listed in the tables are valid under the following conditions:

- The measuring device is installed and operated in accordance with the manufacturer’s installation instructions.
- It must be ensured that the flowmeter is not heated by the effects of additional heat radiation (sunshine, neighbouring system components) and thus operated above the permissible ambient temperature range.

- Insulation must be limited to the piping. Unobstructed ventilation of the signal converter must be ensured.

The permitted ambient temperature range is indicated on the nameplate; depending on the device version it is \( T_{\text{amb}} = -40\ldots+65^\circ C / -40\ldots+149^\circ F \).

The minimum product temperature is \(-40^\circ C / -40^\circ F\).

When using in zone 21, observe the maximum permissible product and ambient temperatures for temperature class 2 and the information for use of a heat-resistant connecting cable and cable entry.
Max. permissible product and ambient temperatures with signal converter or connection box mounted above the flow sensor

### Temperature class in °C

1. Permanent service temperature of connecting cable and cable entry min. 176°F

### 2.8 Surface temperature for equipment category II 2 D

For use in areas with flammable dust it should be noted that the indicated maximum surface temperature of T70°C at an ambient temperature of 65°C / 149°F and a product temperature of 65°C / 149°F is valid without a dust coating.

For higher product temperatures the maximum surface temperature is defined by the product.
2.9 Electrical data

**Signal circuits**

The vortex flowmeter signal circuits may only be connected to circuits with the following maximum values. A safety value of $U_m = 253$ V is considered for the power supply units.

① Further information for operation of the FF transmitter are provided in separate supplementary instructions.

② Further information for operation of the PA transmitter are provided in separate supplementary instructions.

**Flow sensor circuits**

For the compact versions, the intrinsically safe flow sensor circuits are designed as internal circuits.

For the remote versions, the intrinsically safe flow sensor circuits are led through. The maximum permissible safety values of the flow sensor circuits are listed below:

**Remote signal converter, flow sensor circuit (terminal 1 to 7, colour-coded)**

$U_o = 6.65$ V; $I_o = 1107$ mA; $P_o = 650$ mW; $C_o = 1.5$ μF; $L_o = 73$ μH

**Remote flow sensor (terminal 1 to 7, colour-coded)**

$U_i = 7$ V; $I_i = 1107$ mA; $P_i = 650$ mW; $C_i = 0$; $L_i = 0$

**INFORMATION!**

The verification of intrinsic safety for the interconnection between the flow sensor an the signal converter is not necessary, if the cable length does not exceed 50 m / 164 ft and the supplied cable is used.
3.1 Mounting

Mounting and setup must be carried out according to the applicable installation standards (e.g. EN 60079-14) by qualified personnel trained in explosion protection. The information given in the manual and these instructions must always be observed.

Vortex flowmeters must be installed in such a way that
- no external forces are affecting the indication unit.
- the device is accessible for any necessary visual inspections and can be viewed from all sides.
- the nameplate is clearly visible.
- it can be operated from a location with secure footing.

**CAUTION!**
The manufacturer is not liable for any damage resulting from improper use or use other than the intended purpose. This applies in particular to hazards due to insufficient corrosion resistance and suitability of the materials in contact with product.

Aligning the signal converter
The signal converter and the connection box for the remote versions may be aligned on the base or the wall bracket up to a maximum of ± 180°. For this reason, the M4 hexagon socket screw connecting the base and the signal converter or the connection box must be loosened. Once the signal converter or the connection box has been turned, it must be screwed back on to the base again (tightening torque 2 Nm).

- De-energise the signal converter.
- Loosen the hexagon socket screw ①.
- Turn the signal converter or the connection box.
- Screw signal converter or connection box back to the base again.
3.2 Special conditions

**Flameproof joints in the housing**
The housing must be replaced if there is any damage to the joint area. The flameproof thread gaps and the cylindrical joint between the terminal and the electronics compartments must be inspected visually after opening.

*WARNING!*
Repairs of the flameproof joints are not allowed.

**Electrostatics**
For painted versions, risks due to electrostatic charge must be minimized.
For further information refer to *Electrostatic charge* on page 27.

**Thermal and electrical data**
Observe the maximum ambient and product temperatures and electrical data. For further information refer to *Ambient temperature / temperature classes* on page 10 and refer to *Surface temperature for equipment category II 2 D* on page 17 and refer to *Electrical data* on page 18.
4.1 General notes

**Rated values for insulation**
- The insulation of the vortex flowmeter OPTISWIRL 4200 ... - Ex is rated in compliance with IEC 60 664-1.
  The following rating parameters are taken into account:
  - Overvoltage category for signal and instrument loops: II
  - Pollution degree of the insulation: 2

**Terminal compartment**
The signal circuit is electrically connected in the terminal compartment of the signal converter.
The terminal compartment is designed in protection type “d” and/or “e” or in protection type “t”.
Unused entries are to be closed in accordance with EN 60079-1, EN 60079-7 or EN 60079-31.
The entry of the cables in the connection terminal is possible in the following way.

- **Device version Ex db ia IIC T6...T2 Gb or Ex db [ia] IIC T6**
  Direct entry of the connecting cables by way of approved flameproof cable glands (M20x1.5) into the flameproof terminal compartment (V ≤ 2000 cm³). The cable glands require a separate test certificate in accordance with EN 60079-1. Observe the requirements of the test certificate for the cable glands.

- **Device version Ex db ia IIC T6...T2 Gb or Ex db [ia] IIC T6**
  Direct entry of the connecting cables by way of conduits into the flameproof enclosed terminal compartment of the device. Once the conduit has been screwed in, it must form a flameproof joint with the housing with a minimum thread length of 8 mm. A suitable mechanical stopping box must be provided in accordance with installation provisions. The conduit must be installed in compliance with its separate test certificate.

- **Device version Ex db eb ia IIC T6...T2 Gb or Ex db eb [ia] IIC T6**
  Direct entry of the connecting cables by way of approved cable glands (M20x1.5) into the terminal compartment in protection type increased safety.
  The cable glands require a separate test certificate in accordance with EN 60079-7. Observe the requirements of the test certificate for the cable glands.

- **Device version Ex tb ia IIIC T70...T240 Db or Ex tb [ia] IIIC T70°C Db**
  Direct entry of the connecting cables by way of approved dustproof cable glands (M20x1.5) into the dustproof terminal compartment (V ≤ 2000 cm³). The cable glands require a separate test certificate in accordance with EN 60079-31. Observe the requirements of the test certificate for the cable glands.
Connecting cables
The connecting cables should be selected according to the applicable installation standards (e.g. EN 60079-14 / VDE 0165) and the maximum operating temperature.

The connecting cable between the flow sensor and the wall bracket for remote versions is part of the supply.

- The connecting cables must be fixed and laid so they are sufficiently protected against damage.
- Lay cables so as to ensure that there is sufficient distance between surfaces of the flow sensor and the connecting cable.
- Supplied blind plugs / cable entries guarantee protection against foreign objects and water (protection category) IP66/67 according to EN 60529.
- The outer diameter of the connecting cable must be within the sealing range of the cable entry (7...12 mm / 0.28...0.47”).
- Unused cable entries are to be closed in accordance with EN 60079-1 and/or EN 60079-7 and/or EN 60079-31 (>IP66/67).
- Before connecting or loosening the equipotential bonding cable, ensure there are no differences in potential.

Ensure that the gaskets and incised gasket ring are tight.

**CAUTION!**
The IP protection category of the signal converter housing is largely determined by the cable gland used and the installation.

Connection terminals
The capacity of the connection terminals is 0.5 mm² to 2.5 mm².

The torque of the connection terminals is 0.6 Nm.
4.2 Power supply

The vortex flowmeter does not require a separate power supply. The required supply for the built-in electronics is provided via the 4...20 mA current output or the bus connection.

4.3 Inputs / Outputs

The terminal assignment of the built-in electrical equipment is described in the standard documentation. The signal circuits of the vortex flowmeter may only be connected to downstream devices or circuits that satisfy the requirements of protective extra-low voltage (PELV).

Connecting the power supply and the I/O functions

- Before connecting or disconnecting the electrical connection cables of the device, make sure that all cables leading to the converter are isolated from the ground of the hazardous area. This also applies to protective earth (PE) and equipotential bonding conductors (PA).
- All connecting cable conductors and shields that are not securely connected to the equipotential grounding system of the hazardous area shall be carefully isolated from each other and from ground [test voltage $1500 \, V_{\text{eff}}$ for non-intrinsically safe cables].
4.4 Grounding and equipotential bonding

**CAUTION!**

**Equipotential bonding**

Vortex signal converters and flow sensors must be included in the on-site equipotential bonding system according to EN 60079-14! They are connected to the PA terminals.

For compact versions and measuring devices with flange connections, the flow sensor is conductively connected to the pipeline. For compact versions and measuring device of the type "sandwich", a separate conductor connected either to the internal or external PA terminal must be provided to connect to the equipotential bonding.

![Figure 4-1: Ground connection of the compact version](image)

1. Electrical grounding connection on connection piece between the flow sensor and the signal converter
2. Electrical grounding terminal in the housing

For remote versions the connection of the flow sensor can either be made via the PA connection in the terminal compartment of the signal converter or via the external PA connection.

![Figure 4-2: Ground connection of the remote version](image)

1. Electrical grounding connection on the flow sensor
2. Electrical grounding connection on the housing of the signal converter
4.5 Flow sensor circuits (remote version only)

Observe the following points when connecting the flow sensor to the signal converter:

- Use only the supplied connecting cable (max. length 50 m / 164 ft).
- Before connecting or loosening the equipotential bonding cable, ensure there are no differences in potential.
- Connect the connecting cable shield to the equipotential bonding of the hazardous area in the wall bracket. On the flow sensor side, the shield must be carefully isolated from the earth (test voltage 500 V_{eff}) and connected via the terminal end to the corresponding connector on the terminal block.
- The terminal compartments of the flow sensor circuits are supplied with a bridge between the internal PA connection and the terminal with the designation “gnye”. This connection must not be separated.

![Figure 4-3: Connection of the remote version](image)

The flow sensor circuit is designed in protection type “intrinsic safety Ex ia IIC”.

1. Connection terminal flow sensor
2. Connection terminal signal converter
3. Connection shielding flow sensor
4. Shielding (drain wire and overall shield)
5. Connection shielding signal converter
6. Heat shrink tubing
5.1 Start-up

Start-up is only permitted when the measuring device:

• is correctly installed in the system and connected.
• has been checked for the proper state with regard to its installation and connection requirements.
• has been correctly locked to the electronics and terminal compartment.

The electronics and terminal compartment of the vortex flowmeter must be locked during operation. The covers for the electronics and terminal compartment are secured by a lock. First manually tighten the covers until the stop. Then loosen the covers (≤ 90°) so that the lock (special closure) can be secured in the next possible position in the cover.

Use a WS3 Allen key to turn the screw.

No waiting period is necessary prior to opening the housing.

The operator of the system has to check prior to start-up, if the start-up was in compliance with the national regulations for checks.

If the device needs to be configured due to the existence of an explosive atmosphere, this can be done using the supplied bar magnets. There is no need to open the housing as it can be done through the glass window of the electronics compartment or digitally via the signal output (HART® interface).

5.2 Operation

Vortex flowmeters must be operated in such a way that they remain within the maximum and minimum permissible temperatures and pressures and the electrical limit values.

Vortex flowmeters may only be operated if the equipment parts necessary for safety are effective in the long run, and are not rendered inoperable during operation.

In case of operation with flammable products the measuring units must be included in the periodic pressure tests of the system.

Opening the signal converter (protection type "flameproof enclosure" or "dustproof housing" or "terminal compartment in increased safety") in hazardous areas is only permitted in a de-energised state.
5.3 Electrostatic charge

In order to avoid ignition hazards due to electrostatic charge, vortex flowmeters may not be used in areas with:

- processes that generate strong charges,
- mechanical friction and cutting processes,
- spraying of electrons (e.g. in the vicinity of electrostatic painting systems) or
- pneumatically conveyed dust is exposed.

CAUTION!

Electrostatic charging of the housing surface by friction must be avoided. The devices must not be dry cleaned.
6.1 Maintenance

Maintenance work of a safety-relevant nature within the meaning of explosion protection may only be carried out by the manufacturer, his authorised representative or under the supervision of authorised inspectors.

Treat cover threads as necessary with the lubricating paint UNIMOLY C220®.

For systems in hazardous areas, regular tests are required in order to maintain the proper condition.

The following checks are recommended:
- Check the housing, the cable entries and the feed lines for corrosion and/or damage.
- Checking the measuring unit and the piping connections for leakage.
- Check the measuring unit and the indicator for dust deposits.
- Including the flowmeter in the regular pressure test of the process line.

6.2 Dismantling

Exchanging the built-in equipment
The dismantling and installation is within the responsibility of the operator.

Due to the modular design of the vortex flowmeters, from a safety perspective, the electrical equipment built into the signal converter can be replaced with identical spare parts. To do so, remove the housing cover. Close the housing cover immediately after the spare parts are exchanged. Ensure that the cover seal is tight.

General notes
Only identical displays or components from the manufacturer may be used.

The device must be de-energised, if it is absolutely necessary to open the flameproof enclosure or the dustproof electronics compartment in the presence of a potentially explosive atmosphere.

Before connecting or disconnecting the electrical connection cables of the device, make sure that all cables leading to the signal converter are isolated from the ground of the hazardous area. This also applies to protective earth (PE) or functional earth (FE) and equipotential bonding conductors (PA).

Display
The display can be rotated in 90° increments. It is connected to the connector as shown in the following figure.

Exchanging the converter insert
It is permitted to replace the entire VFC 200 converter insert with a brand-new version identical in construction.
Take special note of the following figure and:

- ensure that the construction is the same by checking the nameplates.
- the connecting cable of the flow sensor circuits is to be laid in the cutout provided between the converter insert and housing. Avoid damage such as that caused by crushing.
- proper connection of the flow sensor \( \text{Fig. 6-1} \) and the display connector \( \text{Fig. 6-1} \).
- tighten the mounting screws M4 \( \text{Fig. 6-1} \) evenly.

**Figure 6-1: Connection of the signal converter module**

- \( \text{Fig. 6-1} \): Connector for LC display
- \( \text{Fig. 6-1} \): Service connector
- \( \text{Fig. 6-1} \): SIL jumper
- \( \text{Fig. 6-1} \): Display clamps
- \( \text{Fig. 6-1} \): Connection to the flow sensor
- \( \text{Fig. 6-1} \): Nameplate of the converter insert
- \( \text{Fig. 6-1} \): Fixing screw

**Exchanging the entire device**

The dismantling and installation is within the responsibility of the operator.

Before disconnecting the electric connecting cable of the device, make sure that all cables leading to the indication unit are isolated from the ground of the hazardous area. This also applies to functional earthing conductors (FE) and equipotential bonding conductors (PA).

Observe the information above. Also, ensure that all process connections and the pipeline are depressurised and free of product. Where environmentally critical products are concerned, carefully decontaminate the wetted parts of the flange system after dismantling.

**CAUTION!**

- **Pressurised pipes have to be depressurised before removing the measuring unit.**
- **In the case of environmentally critical or hazardous products, appropriate safety precautions must be taken with regard to residual liquids in the measuring unit.**
- **New gaskets have to be used when re-installing the device in the piping.**
