H250 M40

The modular variable area flowmeter

- Secure, cost-effective measurement and indication, even without power supply
- Modular, can be expanded up to FOUNDATION™ fieldbus
- A device that meets all global Ex requirements
- Sturdy, closed tube design for high resistance to pressure, temperature and medium
Welcome to KROHNE. As a leader in process measuring technology, we’re at home in a wide variety of industries worldwide. The name KROHNE has stood for innovative and reliable solutions since 1921. The company now offers a whole spectrum of instruments for flow, level, temperature and pressure measurement as well as process analysis. Our portfolio is rounded out by comprehensive services and consulting.

Cost-effective and reliable variable area flowmeters are the first choice for the applications where a local indication is required to guarantee the redundancy of a measurement and the safety of a plant. And it is especially in industries with a safety as a key factor, e.g. nuclear sector – where our devices are put to the test in comprehensive test programs in terms of capability and suitability, that this reliability has been appreciated for over 30 years.

With H250 M40 we drive forward proven variable area technology to set the benchmark in the market.
Proven quality from KROHNE

From universal to one-of-a-kind: KROHNE’s H250 variable area flowmeters cover the entire range of requirements in the process industry.

At KROHNE, the modular device design of the H250 M40 combined with a flexible production structure form the basis for application and customer specific versions.

As with every KROHNE variable area flowmeter, you can count on reliability and repeatability. Each device is individually calibrated for the respective application. And the robust metal version – available in a variety of materials – provides a high degree of resistance to pressure, temperature and medium.

Automated welding processes with radiographic inspection and surface crack detection as well as other quality assessments such as material certificates, pressure, leak and hardness testing, all under the control of a seamless quality management system, form the basis for the devices being authorised for use in areas where safety is critical such as chemical plants and nuclear power stations.

Typical applications:

- Measurement of small amounts of chemicals, additives or process gases
- Nitrogen inertisation
- Injection of corrosion and scale inhibitors
- Sealing gas monitoring on compressors
- Coolant and lubricant supply
- Protection against dry running of pumps
- Process water or air supply
Application-oriented and always ready for new tasks

Modularity of electronics

The H250 M40 is purely mechanical in design and this forms the basis for its flexible uses. Additional electronic modules can be added or replaced at any time, making it possible to scale the functionality at will. This way the device adapts easily to any changing requirements.

Anything is possible, from analogue flow measurement without auxiliary power to digital integration into a fieldbus system.

Simply screw off the cover, insert the module until it clicks, screw the cover back on and that’s it. There is no need for tools or to interrupt the process for the functionality to be scaled at will. It is just as easy to replace the measuring scale in the event of a change in application.

It couldn’t be easier.
## Electrical options

**Limit switches**
- 3 versions:
  - 2-wire NAMUR contact as per IEC 60947-5-6
  - 3-wire transistor output 10-30 VDC
  - Potential-free reed switch

**2-wire sensor module with 4...20 mA current output**
- 4...20 mA for 0...100% flow
- Can be combined with limit switches
- 14-30 VDC power supply
- HART® certified communication
- Internal interface to extension modules
- Simple loop-check at push of button

**Totaliser with pulse output, limit switches and LCD**
- Counter module with graphic display to indicate flow, counter reading, additional information and operating menu
- Power supply via sensor module
- Operation and parameter setting via internal microswitch or externally using a bar magnet

**Fieldbus communication**
- PROFIBUS® PA or FOUNDATION™ fieldbus
- Power supply for entire device from 2-wire bus (16 mA current consumption)
- Direct bus communication without additional converter
The package for hazardous areas

H250 M40 from KROHNE offers a **universal Ex-design** across a wide range of usage zones and protection types.

All electronic components are designed **intrinsically safe and non-sparking** and can be used in areas that are explosive due to the presence of gas or dust. As an option, the same components, featuring a **safety housing**, can be installed as explosion proof devices. One device can thus accommodate the different regional explosion protection strategies.

H250 M40 is **ATEX-, IECEx- and FM-approved** for the USA and Canada and also according to **NEPSI** for China. In addition, the measuring device also features other local approvals such as **INMETRO, CCOE/PESO, KGS and EAC**.

Whether it’s intrinsically safe or explosion proof – the devices are designed as **IP66/IP68** or **NEMA 4X/6** as standard. An **IP69K** version is also available on request.
Intrinsically safe electronics

Explosion proof housing

superior Performance
The measuring principle allows for a robust, closed tube design without sensor feedthrough, as the height of the float is transferred to the indicator by way of a magnetic coupling. This enables high pressure versions that can withstand up to 900 barg / 13,000 psig.

All wetted, pressurised parts are made as standard of 1.4404/316L stainless steel and meet the requirements of the NACE MR0175/MR0103 standard. To guarantee the longevity of the device even with chemically harsh products, it is possible to use special materials such as Hastelloy®, titanium, Monel®, 6Mo, Inconel® etc. in production.

In addition, the H250 C M40 is also available with a PTFE liner for applications involving aggressive acids and bases.
Special indicator variants for extreme operating conditions

With the **indicator housing made of stainless steel**, the H250 M40 R withstands attacks from salt fogs and contaminated precipitates. It can be reliably used in corrosive atmospheres and is perfectly suited for use in spray water zones, such as in the food and beverage industries.

Unique to date: The indestructible stainless steel housing is also available on request in an **explosion proof version** for use in hazardous areas.

As a **high-temperature variant**, the H250 M40 HT measuring device is suitable both for very high product temperatures up to +400 °C/+752 °F as well as cryogenic applications down to -200 °C/-328 °F. The increased distance between the measuring tube and the display makes it easier to insulate the measuring tube.
The H250 F M40 is the only variable area flowmeter with EHEDG approval for food and pharmaceutical applications. FDA-compliant materials meet strict hygienic and legal regulations. A design with no dead spaces or stagnation zones as well as the electro-polished surface of the wetted parts with a surface roughness Ra <0.8 µm make it difficult for deposits to settle and facilitate proper cleaning.

The outstanding properties of the H250 F M40 are used in the pharmaceutical industry in areas such as ultrapure water plants and in the food industry e.g. for cream measurement.
The expanded measuring range provides more process information

Depending on the technology, the standard measuring range span of the H250 M40 is 10:1. As an option, it is possible to refine the measuring range span – and this is worldwide unique for measuring devices in this category – to 100:1. This way the otherwise necessary additional measuring devices for small quantities are no longer necessary.
The right solution for any installation direction

Typically, variable area flowmeters are installed vertically in rising pipes and the product must flow through them from bottom to top. This can lead to considerable expense.

The H250 M40 measuring device on the other hand offers you freedom in terms of design as unique versions can be used for horizontal or even descending pipes.
Thanks to a *wide variety of process connections* – common flange connections in accordance with DIN, ASME and JIS, male and female threads as well as clamp connections – this device is available to all sectors of industry.

Free choice of process connections

![Diagram of process connections](image_url)
Like all members of the H250 product family, the H250 M40 features the advantages of variable area technology. It guarantees reliable and precise flow measurement and provides a high degree of application reliability, even with very low flow rates. This is maintained through excellent long-term stability.

The H250 M40 measuring device is all-purpose, especially for applications with low flow rates. It is suitable for the measurement of gases as well as conducting and non-conducting liquids, even those that are highly viscous. Thanks to the modular design of the indicator, it can even be used where there is no connection to the power supply, or where this is difficult but it can also be integrated into any type of process control or monitoring system. It can be upgraded at a later date simply by adding modules and there is no need to replace the existing measuring devices.

User-friendliness was the top priority for KROHNE when developing the H250 M40. Following simple mechanical installation and start-up with a electrical connection if applicable, the device is immediately ready to use and it is good for long-term maintenance-free operation.

Economical all the way: High flexibility as well as low purchase and operating costs make the H250 M40 variable area flowmeter a cost-effective all-rounder!
Variable area measuring device family from KROHNE at a glance

Metal devices

• For extreme process conditions
  - High/low temperatures
  - High pressures
  - Aggressive products
• Limit switches, current output, counters and communication possible

H250 M40
The standard device for the process industry, explosion proof or intrinsically safe

DK32, 34, 37
With mechanical or electronic display and dosing valve for precise adjustment of small flow rates
Glass devices

- Very reasonably priced
- Product visible
- Up to max. 10 barg / 145 psig and +100 °C / +212 °F
- Change of glass possible
- Optional: limit switches

VA40, 45
All-purpose flowmeters with various process connections

DK46, 47, 48, 800
Small, compact purge meters with valve
