1.1 Software History

The “Electronic Revision” (ER) is consulted to document the revision status of electronic equipment according to NE 53 for all GDC devices. It is easy to see from the ER whether troubleshooting or larger changes in the electronic equipment have taken place and how that has affected the compatibility.

Changes and effect on compatibility

1.2 Intended use

CAUTION!
Responsibility for the use of the measuring devices with regard to suitability, intended use and corrosion resistance of the used materials against the measured fluid lies solely with the operator.

INFORMATION!
The manufacturer is not liable for any damage resulting from improper use or use for other than the intended purpose.

The intended use of the sensor SMARTPAT PH 2390 is the measurement of pH in liquids.

1.3 Certifications

CE marking

The device fulfils the statutory requirements of the following EC directives:

• EMC Directive 2004/108/EC (valid until 2016/04/19) or
EMC Directive 2014/30/EU (valid from 2016/04/20)

as well as

• NAMUR recommendation NE 21

The manufacturer certifies successful testing of the product by applying the CE marking.
1.4 Safety instructions from the manufacturer

1.4.1 Copyright and data protection

The contents of this document have been created with great care. Nevertheless, we provide no guarantee that the contents are correct, complete or up-to-date.

The contents and works in this document are subject to copyright. Contributions from third parties are identified as such. Reproduction, processing, dissemination and any type of use beyond what is permitted under copyright requires written authorisation from the respective author and/or the manufacturer.

The manufacturer tries always to observe the copyrights of others, and to draw on works created in-house or works in the public domain.

The collection of personal data (such as names, street addresses or e-mail addresses) in the manufacturer’s documents is always on a voluntary basis whenever possible. Whenever feasible, it is always possible to make use of the offerings and services without providing any personal data.

We draw your attention to the fact that data transmission over the Internet (e.g. when communicating by e-mail) may involve gaps in security. It is not possible to protect such data completely against access by third parties.

We hereby expressly prohibit the use of the contact data published as part of our duty to publish an imprint for the purpose of sending us any advertising or informational materials that we have not expressly requested.

1.4.2 Disclaimer

The manufacturer will not be liable for any damage of any kind by using its product, including, but not limited to direct, indirect or incidental and consequential damages.

This disclaimer does not apply in case the manufacturer has acted on purpose or with gross negligence. In the event any applicable law does not allow such limitations on implied warranties or the exclusion of limitation of certain damages, you may, if such law applies to you, not be subject to some or all of the above disclaimer, exclusions or limitations.

Any product purchased from the manufacturer is warranted in accordance with the relevant product documentation and our Terms and Conditions of Sale.

The manufacturer reserves the right to alter the content of its documents, including this disclaimer in any way, at any time, for any reason, without prior notification, and will not be liable in any way for possible consequences of such changes.
1.4.3 Product liability and warranty

The operator shall bear responsibility for the suitability of the device for the specific purpose. The manufacturer accepts no liability for the consequences of misuse by the operator. Improper installation or operation of the devices (systems) will cause the warranty to be void. The respective “Standard Terms and Conditions” which form the basis for the sales contract shall also apply.

1.4.4 Information concerning the documentation

To prevent any injury to the user or damage to the device it is essential that you read the information in this document and observe applicable national standards, safety requirements and accident prevention regulations.

If this document is not in your native language and if you have any problems understanding the text, we advise you to contact your local office for assistance. The manufacturer cannot accept responsibility for any damage or injury caused by misunderstanding of the information in this document.

This document is provided to help you establish operating conditions, which will permit safe and efficient use of this device. Special considerations and precautions are also described in the document, which appear in the form of icons as shown below.
1.4.5 Warnings and symbols used

Safety warnings are indicated by the following symbols.

**DANGER!**
This warning refers to the immediate danger when working with electricity.

**DANGER!**
This warning refers to the immediate danger of burns caused by heat or hot surfaces.

**DANGER!**
This warning refers to the immediate danger when using this device in a hazardous atmosphere.

**DANGER!**
These warnings must be observed without fail. Even partial disregard of this warning can lead to serious health problems and even death. There is also the risk of seriously damaging the device or parts of the operator’s plant.

**WARNING!**
Disregarding this safety warning, even if only in part, poses the risk of serious health problems. There is also the risk of damaging the device or parts of the operator’s plant.

**CAUTION!**
Disregarding these instructions can result in damage to the device or to parts of the operator’s plant.

**INFORMATION!**
These instructions contain important information for the handling of the device.

**LEGAL NOTICE!**
This note contains information on statutory directives and standards.

• **HANDLING**
  This symbol designates all instructions for actions to be carried out by the operator in the specified sequence.

  • **RESULT**
  This symbol refers to all important consequences of the previous actions.

1.5 Safety instructions for the operator

**WARNING!**
In general, devices from the manufacturer may only be installed, commissioned, operated and maintained by properly trained and authorized personnel. This document is provided to help you establish operating conditions, which will permit safe and efficient use of this device.
2.1 Scope of delivery

**INFORMATION!**
Inspect the packaging carefully for damages or signs of rough handling. Report damage to the carrier and to the local office of the manufacturer.

**INFORMATION!**
Do a check of the packing list to make sure that you have all the elements given in the order.

**INFORMATION!**
Look at the device nameplate to ensure that the device is delivered according to your order.

![Figure 2-1: Standard scope of delivery](image)

1. Ordered sensor
2. Documentation

Optional accessories
- SENSOFIT IMM 2000 series - Immersion assemblies
- Cable VP2-S (cable with shield in various lengths)
- SMARTMAC 200 W - Wall mount display with calibration and configuration function
- SD 200 W/R - Wall or rack mount indicator
- OPTIBRIDGE / SMARTBRIDGE – USB interface cable
- SJB 200 W-Ex – Junction box

Consumables/Spare parts available
- Various pH buffer solutions for sensor calibration
- Various cleaning solutions

**INFORMATION!**
For further information contact your local sales office.
2.2 Device description

Figure 2-2: Construction of the sensor

- 1 VP2 connector
- 2 3/4 - 14 NPT (male)
- 3 Ryton® body
- 4 3/4 - 14 NPT (male)
- 5 Diaphragm
- 6 Protection cap
- 7 KCl solution
2.3 Nameplate

![Nameplate Example]

In the nameplate:
1. Manufacturer
2. Address
3. Device name
4. TAG number
5. Order code
6. Manufacturing date / Ingress protection
7. Serial number
8. Electronic/electric device waste marking;
   Observe the operation and installation instruction / Approvals

**INFORMATION!**

Look at the device nameplate to ensure that the device is delivered according to your order.

The sensor type is specified on the label of the sensor package and on the sensor itself.
3.1 General notes on installation

**DANGER!**
For devices used in hazardous areas, additional safety notes apply; please refer to the Ex documentation.

**DANGER!**
All work on the electrical connections may only be carried out with the power disconnected.

**DANGER!**
Observe the national regulations for electrical installations!

**WARNING!**
During installation of the device make sure that you use ESD (electrostatic discharge) protection equipment.

**WARNING!**
Observe without fail the local occupational health and safety regulations. Any work done on the electrical components of the measuring device may only be carried out by properly trained specialists.

**INFORMATION!**
Inspect the packaging carefully for damages or signs of rough handling. Report damage to the carrier and to the local office of the manufacturer.

**INFORMATION!**
Do a check of the packing list to make sure that you have all the elements given in the order.

**INFORMATION!**
Look at the device nameplate to ensure that the device is delivered according to your order.
3.2 Storage and transport

**CAUTION!**
Do not store the sensor tip dry. This will shorten lifetime considerably. Always store the pH sensor tip wet in a 3 molar KCl solution when not in use. Saltless water must be avoided since this would leak the KCl ions. The original packing in which the sensor tip was delivered contains a plastic tube with KCl solution and therefore is suitable for storage and transport.

- Since the pH sensor is made out of glass it is very fragile. Avoid shocks of any kind.
- Do not touch or scratch the membrane glass.
- Store and transport the device in a dry, dust-free environment.
- Store and transport the device in an environment with a temperature between 4...+30°C / 40...+86°F.
- The original packing is designed to protect the equipment. It has to be used if the device is transported or sent back to the manufacturer including the sensor transportation packing, to prevent damage of the sensor.

3.3 Pre-installation requirements

**CAUTION!**
- Do not drop the device! Handle the device with care!
- Never touch or scratch the pH membrane glass of the sensor.
- Store the sensor in its original packaging in a dry, dust-free location. Keep it away from dirt. If necessary, clean it. See cleaning procedure on page 30.
- Do not make any mechanical modifications to the sensor (electrodes shortened, drilled, bent or scratched). This can result in the loss of proper functionality, as well as the rights under the device warranty.
- The sensor must be suitable for the temperature, pressure and medium conditions which are specified (including chemical resistance).

**INFORMATION!**
A sensor specific DTM software for usage with PACTware™ FDT is available. The DTM software is free of charge and available from CD (scope of delivery) or can be downloaded from the KROHNE website (Downloadcenter).
Unpacking the sensor
• Gently pull the protection cap from the sensor ①.
• Lay the sensor on a soft mat/tissue ②.
• Keep the protection cap in the original packaging ③.

3.4 Installation procedure

WARNING!
During installation of the device make sure that you use ESD (electrostatic discharge) protection equipment.

Because a new pH sensor needs to be calibrated before it is installed into its final measuring location, it is important to follow the installation order:

① Connect the sensor to the junction box or directly to the process control system.
② Calibrate the sensor.
③ Install the sensor into its final measuring location.

The required steps are explained in the following sections.
4.1 Safety instructions

**DANGER!**
For devices used in hazardous areas, additional safety notes apply; please refer to the Ex documentation.

**DANGER!**
All work on the electrical connections may only be carried out with the power disconnected.

**DANGER!**
Observe the national regulations for electrical installations!

**WARNING!**
Observe without fail the local occupational health and safety regulations. Any work done on the electrical components of the measuring device may only be carried out by properly trained specialists.

**INFORMATION!**
Look at the device nameplate to ensure that the device is delivered according to your order.

4.2 Power supply

**CAUTION!**
Do not use the integrate 250 Ohm HART® resistor of the SMARTMAC 200 W, when using an Ex isolation amplifiers of third-party with integrated 250 Ohm HART® resistor.

The sensor requires a minimum operating voltage of 15 VDC. The power supply is provided via the 2-wire interface (4...20 mA).

During initialisation of the sensor following values appear in the display mode of the "Measuring value":

- Conductivity: NaN
- Resistance: NaN
- Temperature: NaN
- Loop current: NaN

The specification NaN (Not a Number) disappears after a few seconds once the initialisation of the sensor is completed. Afterwards, the measured values appear.
4.3 Grounding and equipotential bonding

Sensor type SMARTPAT pH must be grounded (hard grounding or capacitive connection to ground).

SJB 200 W-Ex junction box offers the grounding possibility. For further information refer to the SJB 200 W-Ex manual.

For connection of SMARTPAT sensor use only a VarioPin cable with shield wire, like the cable VP2-S.

4.4 Connecting the cable to the sensor

WARNING!
During installation of the device make sure that you use ESD (electrostatic discharge) protection equipment.

CAUTION!
Moisture on the sensor connector must be avoided! Moisture may cause a short-circuit and a malfunction of the sensor!
If moisture has entered the connector dry it with air (e.g. hot air gun).

Figure 4-1: Connecting the cable to the sensor

Connecting the cable to the sensor

• Ensure that both cable and sensor connector are absolutely dry ①.
• Screw the cable connector ② on the sensor connector and tighten it by hand.
4.5 Connecting the sensor cable

**DANGER!**
All work on the electrical connections may only be carried out with the power disconnected.

**INFORMATION!**
The cable glands installed by the manufacturer are designed for a cable diameter of 8 mm...13 mm / 0,31”...0,51”. If you are using cables with a larger diameter, you must replace the manufacturer’s cable glands with suitable ones. The operator is responsible for the correct sealing of cable glands.

**INFORMATION!**

The SJB 200 W offers the opportunity to access the sensor via HART\textsuperscript{®} hand held. For further information refer to the manual of the SJB 200 W.
4.7 Installing the sensor

4.7.1 General installation instructions

**WARNING!**
Ensure that the pipeline is without pressure before installing or removing a sensor!

**INFORMATION!**
During installation you should fix a shut-off valve in front of and behind the instrument so that the sensor can be taken out in case of check.

**INFORMATION!**
To achieve reliable measuring results, the electrodes must always have full contact with the measuring medium.

**INFORMATION!**
Basically any installation position is possible. However, ensure that sufficient medium flows through and around the electrodes [the conductive electrodes must always be completely surrounded by the medium]. Structural measures must be taken to prevent flow interruption or gas bubbles.
4.7.2 General installation instructions

The sensor tip must always have full contact with the measuring medium.

The mounting position of the sensor should not deviate more than 75° from vertical position [sensor tip pointing downwards]. Doing otherwise might cause internal air bubbles to float into the sensor tip. This would interrupt the electrical contact between the inner buffer solution and the glass surface.

Figure 4-6: Installation requirements

1. Measuring medium
2. Maximum deviation of 75° from vertical position
4.7.3 Installation steps

- Ensure that the washer and the O-ring is properly fitted, clean and undamaged.
- Ensure that the raised face of the receiving part has a smooth surface
- Screw the device into the thread by hand.

Hand tight connection is sufficient.

For this device the max. torque that can be used is 9 Nm.
5.1 Calibration

5.1.1 Calibration with PACTware™

Manual hold
- Start the function calibration in menu mode Quick Setup or Setup.
- Activate the function manual hold to avoid an alarm.
- Select yes.
- Press Next to proceed.

Temperature compensation
- Set the temperature compensation for calibration.
- Select between automatic or manual.

Temperature compensation
- If you have selected manual temperature compensation, please enter the temperature of the pH buffer solution. Default setting: 25°C / 77°F.
- Press Next to proceed.

Start calibration procedure
- Dip the sensor into the first pH buffer solution 1 and wait till the value is stable.
- Press Next to proceed.

Temperature compensation
- The measurement of pH buffer solution 1 starts and the values pH and temperature appear. After approx. 10 seconds the following values appear:
  - pH value
  - Temperature value
  - Identified buffer value

- Press Next to confirm the identified pH buffer solution. If necessary change the value of the pH buffer solution manually. If the sensor does not recognise the pH buffer solution the message buffer not recognised appears.
- Press Next to proceed.

Temperature compensation
- The value 0 for the pH buffer solution appears. Enter the value of the pH buffer solution manually.
- Press Next to proceed with the calibration procedure.
- Clean the sensor with demineralised water 2.

Figure 5-1: Calibration procedure
• Dip the sensor into the second pH buffer solution and wait till the value is stable.
• Press Next to proceed.

The measurement of pH buffer solution starts and the values pH and temperature appear. After approx. 10 seconds the following values appear:
- pH value
- Temperature value
- Identified buffer value

• Press Next to confirm the identified pH buffer solution. If necessary change the value of the pH buffer solution manually.
  If the sensor does not recognise the pH buffer solution the message buffer not recognised appears.
• Press Next to proceed.

The value 0 for the pH buffer solution appears. Enter the value of the pH buffer solution manually.
• Press Next to proceed with the calibration procedure.
• Clean the sensor with demineralised water.

After a successful calibration the following values appear:
- Buffer solution 1
- Buffer solution 2
- Offset in mV
- Slope in mV/pH

• Press Next to proceed.
• Set the calibration date with DD-MM-YY and calibration time with HH-MM-SS.
• Press Next to proceed.

The message Save values? appears.
• Select yes to save the values.
• Press Next to proceed.
• Select no to deactivate the function manual hold.
• Press Next to leave the calibration menu.

A pH calibration is necessary in regular intervals or when installing a new pH sensor.

If the calibration was not successful, the message Warning! Offset out of range! appears behind the value Offset and/or the message Warning! Slope out of range! behind the value Slope. In case the value of the slope is not plausible, additionally the message No saving possible appears.

• Press Next to proceed.

The messages Warning! Offset out of range! or Warning! Slope out of range! appear.
• Press Next to proceed.
• Set the calibration date with DD-MM-YY and calibration time with HH-MM-SS.
• Press Next to proceed.

The message Save values? appears.
• Select between yes or no.
• Press Next to proceed.
• Select no to deactivate the function manual hold.
• Press Next to leave the calibration menu.

If the message Warning! Slope out of range! appears together with the message No saving possible, no data can be saved.
• Press Next to proceed.
• Select no to deactivate the function manual hold.
• Press Next to leave the calibration menu.

In a fully functional sensor, the optimal slope is -59 mV for each pH unit and the optimal zero point is 0 mV at pH 7. The slope should at least have a value between -50...-65 mV per pH unit. Re-calibrate the sensor if the slope does not approximate those limits. The pH sensor ages, the slope gets flatter and the zero error increases.

**CAUTION!**
• Never touch or scratch the pH sensitive glass tip of the sensor.
• Make sure that the sensor tip is clean and dust-free. If necessary, clean the tip as described on page 30.

**CAUTION!**
Moisture on the sensor connector must be avoided! Moisture may cause a short-circuit and a malfunction of the sensor!
If moisture has entered the connector dry it with air (e.g. hot air gun).

### 5.1.2 Calibration with HART® Handheld 475 FIELD COMMUNICATOR

**Manual hold**
• Start the function calibration in menu mode Quick Setup or Setup.
• Activate the function manual hold to avoid an alarm.
• Select Yes.
• Press Enter to proceed.

**Temperature compensation**
• Set the temperature compensation for calibration.
• Select between automatic or manual.
  ➔ If you have selected manual temperature compensation, please enter the temperature of the pH buffer solution. Default setting: 25°C / 77°F.
• Press Enter to proceed.

**Start calibration procedure**
• Dip the sensor into the first pH buffer solution and wait till the value is stable.
• Press Ok to proceed.
  ➔ The measurement of pH buffer solution 1 starts and the values pH and temperature appear.
After approx. 10 seconds the following values appear:
  pH value
  temperature value
  Status buffer detection → Finished
  identified buffer value
  • Press Ok to confirm the identified pH buffer solution. If necessary change the value of the pH buffer solution manually.
  • Press Enter to proceed.
  ➔ If the sensor does not recognise the pH buffer solution the messages Identified buffer → 0 pH and Buffer not recognised appear.
• Press Ok to proceed.
  ➔ Enter the value of the pH buffer solution manually.

**CAUTION!**
• Never touch or scratch the pH sensitive glass tip of the sensor.
• Make sure that the sensor tip is clean and dust-free. If necessary, clean the tip as described on page 30.
• Press **Enter** to proceed with the calibration procedure.
• Clean the sensor with demineralised water ②.

![Diagram showing calibration procedure](image)

**Figure 5-2: Calibration procedure**

• Dip the sensor into the second pH buffer solution ③ and wait till the value is stable.
• Press **Ok** to proceed.
  - The measurement of **pH buffer solution 2** starts and the values pH and temperature appear. After approx. 10 seconds the following values appear:
    - pH value
    - temperature value
    - Status buffer detection → Finished
    - identified buffer value

• Press **Ok** to confirm the identified pH buffer solution. If necessary change the value of the pH buffer solution manually.
• Press **Enter** to proceed.
  - If the sensor does not recognise the pH buffer solution the messages **Identified buffer → 0 pH** and **Buffer not recognised** appear.

• Press **Ok** to proceed.
• Enter the value of the pH buffer solution manually.
• Press **Enter** to proceed with the calibration procedure.
• Clean the sensor with demineralised water ②.
  - After a successful calibration the following values appear:
    - Buffer solution 1
    - Buffer solution 2
    - Offset in mV
    - Slope in mV/pH

• Press **Ok** to proceed.
• Set the calibration date with MM-DD-YYYY. Press the key > to enter the submenu. Now you can change the calibration date.
• Press **Enter** and **Ok** to proceed.
  - The message **save values?** appears.
• Select **yes** to save the values.
• Press **Enter** to proceed.
• Select **no** to deactivate the function **manual hold**.
• Press **Enter** to leave the calibration menu.

A pH calibration is necessary in regular intervals or when installing a new pH sensor.

If the calibration was not successful, the message **Warning!** appears behind the values **Offset** and/or **Slope**.

• Press **Ok** to proceed.
• Set the calibration date with MM-DD-YYYY. Press the key > to enter the submenu. Now you can change the calibration date.
• Press **Enter** and **Ok** to proceed.

  The messages **Warning! Offset out of range!** and/or **Warning! Slope out of range!** and **Save values?** appear.

• Select between **yes** or **no**.
• Press **Enter** to proceed.
• Select **No** to deactivate the function **manual hold**.
• Press **Enter** to leave the calibration menu.

If the message **ATTENTION! Slope out of range!** appears, no data can be saved.

• Press **Ok** to proceed.
• The message **No saving possible** appears.
• Press **Ok** to proceed.
• Select **no** to deactivate the function **manual hold**.
• Press **Next** to leave the calibration menu.

In a fully functional sensor, the optimal slope is -59 mV for each pH unit and the optimal zero point is 0 mV at pH 7. The slope should at least have a value between -50...-65 mV per pH unit. Re-calibrate the sensor if the slope does not approximate those limits. The pH sensor ages, the slope gets flatter and the zero error increases.

**CAUTION!**
• **Never touch or scratch the pH sensitive glass tip of the sensor.**
• **Make sure that the sensor tip is clean and dust-free. If necessary, clean the tip as described on page 30.**

**CAUTION!**
*Moisture on the sensor connector must be avoided! Moisture may cause a short-circuit and a malfunction of the sensor!*
*If moisture has entered the connector dry it with air (e.g. hot air gun).*
## 5.2 Troubleshooting

6.1 Maintenance

6.1.1 Cleaning

**INFORMATION!**
Recalibrate the sensor after each cleaning procedure.

- Slight dirt residues or dust: Rinse the sensor tip with demineralised water and clean it with a soft tissue.
- Oily and greasy coatings: Remove with a warm soap solution and rinse with demineralised water.
- Hardness deposits or metal hydroxide deposits: Soak the sensor tip including diaphragm in 10% citric acid or hypochloric acid for a couple of minutes and rinse the complete glass shaft of the sensor with demineralised water.
- Biological fouling: Soak the sensor tip including diaphragm in 10% pepsin solution for minimum 3 hours and afterwards rinse the complete glass shaft of sensor with demineralised water.

6.1.2 Aging and re-calibration

During operation, but already during storage, pH sensors age due to poisoning effects of the inner buffer system. Therefore it is important to re-calibrate the sensor in regular intervals. Consider status messages and diagnostic information. For further information refer to Status messages and diagnostic information on page 29.

When the sensor becomes too old to provide reliable measurements, an error message [see on page 23] appears after the calibration procedure. In this case, the sensor has to be replaced.

**Aging effects of sensor:**

- **Decrease of slope** due to abrasion, drying, corrosion of glass tip coating and leaching:
  The slope should be < -50 mV/pH. An optimal value is -59 mV/pH at 25°C / 77°F. When the slope rises above -50 mV/pH, an error message is displayed and the sensor has to be replaced.
  The slope of the sensor is displayed after each calibration procedure.

- **Shift of zero point** due to strong temperature changes, leaching and contamination of reference half cell or increased resistance between glass tip and reference half cell:
  The zero point should lie between -58...+58 mV at pH 7.
  An optimal value is 0 mV at pH 7.
  The zero point of the sensor is displayed after each calibration procedure.

The following figure shows the aging effects:
6.2 Availability of services

The manufacturer offers a range of services to support the customer after expiration of the warranty. These include repair, maintenance, technical support and training.

INFOGRAPHIC!

The lifetime expectation depends heavily on the application. The right choice of the sensor type is very important.

For more precise information, please contact your local sales office.
6.3 Returning the device to the manufacturer

6.3.1 General information

This device has been carefully manufactured and tested. If installed and operated in accordance with these operating instructions, it will rarely present any problems.

CAUTION!
Should you nevertheless need to return a device for inspection or repair, please pay strict attention to the following points:

• Due to statutory regulations on environmental protection and safeguarding the health and safety of the personnel, the manufacturer may only handle, test and repair returned devices that have been in contact with products without risk to personnel and environment.

• This means that the manufacturer can only service this device if it is accompanied by the following certificate [see next section] confirming that the device is safe to handle.

CAUTION!
If the device has been operated with toxic, caustic, flammable or water-endangering products, you are kindly requested:

• to check and ensure, if necessary by rinsing or neutralising, that all cavities are free from such dangerous substances,

• to enclose a certificate with the device confirming that is safe to handle and stating the product used.
### 6.3.2 Form (for copying) to accompany a returned device

**CAUTION!**
To avoid any risk for our service personnel, this form has to be accessible from outside of the packaging with the returned device.

<table>
<thead>
<tr>
<th>Company:</th>
<th>Address:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Department:</td>
<td>Name:</td>
</tr>
<tr>
<td>Tel. no.:</td>
<td>Fax no. and/or Email address:</td>
</tr>
<tr>
<td>Manufacturer’s order no. or serial no.:</td>
<td></td>
</tr>
</tbody>
</table>

The device has been operated with the following medium:

<table>
<thead>
<tr>
<th>This medium is:</th>
<th>radioactive</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>water-hazardous</td>
</tr>
<tr>
<td></td>
<td>toxic</td>
</tr>
<tr>
<td></td>
<td>caustic</td>
</tr>
<tr>
<td></td>
<td>flammable</td>
</tr>
</tbody>
</table>

We checked that all cavities in the device are free from such substances.

We have flushed out and neutralized all cavities in the device.

We hereby confirm that there is no risk to persons or the environment through any residual media contained in the device when it is returned.

Date: Signature:  
Stamp: 

### 6.4 Disposal

**CAUTION!**
Disposal must be carried out in accordance with legislation applicable in your country.

Separate collection of WEEE (Waste Electrical and Electronic Equipment) in the European Union:

According to the directive 2012/19/EU, the monitoring and control instruments marked with the WEEE symbol and reaching their end-of-life must not be disposed of with other waste. The user must dispose of the WEEE to a designated collection point for the recycling of WEEE or send them back to our local organisation or authorised representative.
7.1 Measuring principle

7.1.1 pH measurement

The measuring principle of a pH sensor is based on a pH sensitive glass (membrane glass). When the pH sensitive glass gets into contact with a liquid, a thin layer of hydrated gel develops on the surface, enabling an ion exchange between the glass surface and the liquid. The so-called Nernst potential builds up on the glass surface. If both sides of the glass are in contact with liquids, a voltage may be detected between the two surface potentials. The voltage correlates to the difference in H⁺ ion concentration and thus to the difference of pH values in both liquids.

The pH sensor contains an internal buffer solution with a known pH value. If the pH value of the measuring medium on the outside of the sensor is equal to the pH value of the inner buffer, the resulting voltage is 0 V.

If the pH value of the medium differs from the internal pH value, a voltage between the internal and the external layer can be measured. From the resulting voltage, the pH difference of the two liquids can be calculated.

The voltage is measured using a measuring electrode and a reference electrode; both are built into the sensor. The measuring electrode is in contact with the known buffer solution in the pH sensitive glass bulb. The reference electrode is immersed into a saturated solution of potassium chloride (KCl). The KCl solution itself is in electrical contact with the measuring medium by means of a diaphragm. The diaphragm prevents the measuring medium from penetrating into the reference system but still allows electrical contact with the measuring medium.
The voltage change of a pH sensor at 25°C / 77°F is around -59 mV for each pH unit. This is also called the slope of the pH sensor. The slope is temperature dependent and decreases over lifetime of the sensor.

To compensate for the temperature dependency of the pH measurement, the temperature of the medium can be measured and automatically compensated.
7.2 Technical data

**INFORMATION!**
- The following data is provided for general applications. If you require data that is more relevant to your specific application, please contact us or your local sales office.
- Additional information (certificates, special tools, software,...) and complete product documentation can be downloaded free of charge from the website [Downloadcenter].

8.1 General description

The open HART® protocol, which can be used for free, is integrated into the sensor for communication.

Devices which support the HART® protocol are classified as either operating devices or field devices. When it comes to operating devices (Master), both manual control units (Secondary Master) and PC-supported workstations (Primary Master) are used, for example, a control center.

HART® field devices include sensors, signal converters and actuators. The field devices range from 2-wire to intrinsically safe versions for use in hazardous areas.

The HART® data are superimposed over the analogue 4...20 mA signal via FSK modem. This way, all of the connected devices can communicate digitally with one another via the HART® protocol while simultaneously transmitting the analogue signals.

When it comes to the field devices and secondary masters, the FSK or HART® modem is integrated. If a PC is used, an external modem must be connected to the serial interface (USB interface). There are, however, other connection variants which can be seen in the following connection figures.

8.2 Software history

8.3 Connection variants

**CAUTION!**

*For installation in a multidrop communication system please consider the voltage drop for the 250Ω loop resistance for HART® communication. The supply voltage has to be adjusted.*

The sensor is a 2-wire device with a passive 4...20 mA current output and HART® interface.

- **Multidrop mode is supported**
  In a multidrop communication system, up to 32 devices can be connected to a common transmission cable.

- **Burst mode is not supported**
  In the burst mode a slave device transfers cyclic pre-defined response telegrams, to get a higher rate of data transfer.

There are two ways of using the HART® communication:

- as Point-to-Point connection and
- as Multidrop connection, with 2-wire connection.
8.3.1 Point-to-Point connection - analogue / digital mode

Point-to-Point connection between the sensor and the HART® Master.

The current output of the sensor is passive.

Figure 8-1: Point-to-Point connection

1. Primary master with e.g. PACTware™ FDT/DTM
2. FSK modem
3. HART® signal
4. SMARTMAC 200 W
5. SMARTPAT Sensor
6. Secondary master with HART® DD
7. Power supply for devices (slaves) with passive current output
8. Load ≥ 250 Ω (Ohm)
8.4 Inputs/outputs and HART® dynamic variables and device variables

PV = Primary Variable; SV = Secondary Variable; TV = Tertiary Variable; QV = Fourth Variable

</table>

The HART® dynamic variable PV is always connected to the HART® current output which is assigned to the pH value.

8.5 Field Communicator 475 (FC 475)

The Field Communicator is a hand terminal from Emerson Process Management that is designed to configure HART® and Foundation Fieldbus devices. Device Descriptions (DDs) are used to integrate different devices into the Field Communicator.

8.5.1 Installation

The HART® Device Description for the sensor must be installed on the Field Communicator. Otherwise only the functions of a generic DD are available to the user and the entire device control is not possible. A “Field Communicator Easy Upgrade Programming Utility” is required to install the DDs on the Field Communicator.

The Field Communicator must be equipped with a system card with “Easy Upgrade Option”. For details consult the Field Communicator User’s Manual.
8.6 Field Device Tool / Device Type Manager (FDT/DTM)

A Field Device Tool Container (FDT Container) is basically a PC program used to configure a field device via HART®. To adapt different devices, the FDT container uses a so-called Device Type Manager (DTM).

8.6.1 Installation

If the DTM for the sensor has not yet been installed on the FDT Container, setup is required and is available for download from the website or on CD-ROM. See the supplied documentation for information on how to install and set up the DTM.

</tbody>
</table>

### Calibration

- Slope
- Offset
- Inner buffer
- Buffer solution 1
- Buffer solution 2
- No. of calibrations
- SiP counter
- CIP counter
- Autoclaving counter

### Operating parameters (OP)

- Commissioning date
- Operating hours
  - OP time > 80°C / 176°F
  - OP time > 110°C / 230°F
  - OP time < -300mV
  - OP time > +300mV
- Max. temperature
- Temp. compensation
- Manual temp.

**Commissioning**

**Set date of commissioning**

### 5 Service

#### 1 Service calibration

- Trimming at 4 mA (+/-)
- Trimming at 20 mA (+/-)

#### 2 Service parameter

- Reset of sensor
- Load factory setting

#### 3 Password

- Password protection: Activate or deactivate the password protection. Select between on and off.
- Password operator: Set password for operator
- Password administrator: Set password for administrator
- Reset password: Reset all passwords [only administrator]

#### 4 Sensor lock

- Select between **YES** or **NO** to lock the sensor.
  - If you select **YES** the setting is not reversible anymore and the sensor is invalid for use. The HART® communication is not possible anymore.
9.1 pH as a function of mV

The pH value is the negative decadicative logarithm of the hydrogen ion concentration, and it is directly related to the proportion of hydrogen ions \( H^+ \) to hydroxide ions \( OH^- \) in the media. The pH sensor measures excess or deficit of the hydrogen ions and gives a proportional millivolt signal as output. The signal is 59.16 mV per 1 pH at 25°C / 77°F. In clean water there is a total balance between hydrogen ions and hydroxide ions, the output from the electrode is 0.0 mV and pH is 7. The millivolt signal is measured by the sensor and the corresponding pH value is directly calculated by the sensor.

9.2 pH temperature dependency

The output from a pH sensor varies with the temperature in a predictable way. The size of the variation depends on both the temperature and the pH being measured.

</tbody>
</table>

At pH 7 and 25°C / 77°F the temperature error is zero. If temperature or pH changes the temperature error is calculated using the following formula:

$$0.03 \text{ pH difference} / \text{pH or} \ 0.03 \text{ pH difference} / \text{K}$$
