## 7 Notes ........................................................................... 49
1.1 Intended use

**CAUTION!**
Responsibility for the use of the measuring devices with regard to suitability, intended use and corrosion resistance of the used materials against the measured fluid lies solely with the operator.

**INFORMATION!**
The manufacturer is not liable for any damage resulting from improper use or use for other than the intended purpose.

The TIDALFLUX 2300 is especially designed for measuring the flow of conductive fluids in partially filled pipes. It can only be combined with the IFC 300 PF electromagnetic flow converter.

**WARNING!**
If the device is not used according to the operating conditions (refer to chapter Technical data), the intended protection could be affected.

1.2 Certification

**CE marking**

The manufacturer certifies successful testing of the product by applying the CE marking.

This device fulfills the statutory requirements of the relevant EU directives. For full information of the EU directives and standards and the approved certifications, please refer to the EU Declaration of Conformity or the website of the manufacturer.
1.3 Safety instructions from the manufacturer

1.3.1 Copyright and data protection

The contents of this document have been created with great care. Nevertheless, we provide no guarantee that the contents are correct, complete or up-to-date.

The contents and works in this document are subject to copyright. Contributions from third parties are identified as such. Reproduction, processing, dissemination and any type of use beyond what is permitted under copyright requires written authorisation from the respective author and/or the manufacturer.

The manufacturer tries always to observe the copyrights of others, and to draw on works created in-house or works in the public domain.

The collection of personal data (such as names, street addresses or e-mail addresses) in the manufacturer’s documents is always on a voluntary basis whenever possible. Whenever feasible, it is always possible to make use of the offerings and services without providing any personal data.

We draw your attention to the fact that data transmission over the Internet (e.g. when communicating by e-mail) may involve gaps in security. It is not possible to protect such data completely against access by third parties.

We hereby expressly prohibit the use of the contact data published as part of our duty to publish an imprint for the purpose of sending us any advertising or informational materials that we have not expressly requested.

1.3.2 Disclaimer

The manufacturer will not be liable for any damage of any kind by using its product, including, but not limited to direct, indirect or incidental and consequential damages.

This disclaimer does not apply in case the manufacturer has acted on purpose or with gross negligence. In the event any applicable law does not allow such limitations on implied warranties or the exclusion of limitation of certain damages, you may, if such law applies to you, not be subject to some or all of the above disclaimer, exclusions or limitations.

Any product purchased from the manufacturer is warranted in accordance with the relevant product documentation and our Terms and Conditions of Sale.

The manufacturer reserves the right to alter the content of its documents, including this disclaimer in any way, at any time, for any reason, without prior notification, and will not be liable in any way for possible consequences of such changes.
1.3.3 Product liability and warranty

The operator shall bear responsibility for the suitability of the device for the specific purpose. The manufacturer accepts no liability for the consequences of misuse by the operator. Improper installation or operation of the devices (systems) will cause the warranty to be void. The respective “Standard Terms and Conditions” which form the basis for the sales contract shall also apply.

1.3.4 Information concerning the documentation

To prevent any injury to the user or damage to the device it is essential that you read the information in this document and observe applicable national standards, safety requirements and accident prevention regulations.

If this document is not in your native language and if you have any problems understanding the text, we advise you to contact your local office for assistance. The manufacturer can not accept responsibility for any damage or injury caused by misunderstanding of the information in this document.

This document is provided to help you establish operating conditions, which will permit safe and efficient use of this device. Special considerations and precautions are also described in the document, which appear in the form of icons as shown below.
1.3.5 Warnings and symbols used

Safety warnings are indicated by the following symbols.

**DANGER!**
This warning refers to the immediate danger when working with electricity.

**DANGER!**
This warning refers to the immediate danger of burns caused by heat or hot surfaces.

**DANGER!**
This warning refers to the immediate danger when using this device in a hazardous atmosphere.

**DANGER!**
These warnings must be observed without fail. Even partial disregard of this warning can lead to serious health problems and even death. There is also the risk of seriously damaging the device or parts of the operator’s plant.

**WARNING!**
Disregarding this safety warning, even if only in part, poses the risk of serious health problems. There is also the risk of damaging the device or parts of the operator’s plant.

**CAUTION!**
Disregarding these instructions can result in damage to the device or to parts of the operator’s plant.

**INFORMATION!**
These instructions contain important information for the handling of the device.

**LEGAL NOTICE!**
This note contains information on statutory directives and standards.

- **HANDLING**
  This symbol designates all instructions for actions to be carried out by the operator in the specified sequence.

  - **RESULT**
    This symbol refers to all important consequences of the previous actions.

1.4 Safety instructions for the operator

**WARNING!**
In general, devices from the manufacturer may only be installed, commissioned, operated and maintained by properly trained and authorized personnel.
This document is provided to help you establish operating conditions, which will permit safe and efficient use of this device.
2.1 Scope of delivery

![Image of scope of delivery](image)

- Ordered flowmeter
- Product documentation
- Factory calibration report
- CD-ROM with product documentation
- Grounding rings (optionally)
- Cable

Figure 2-1: Scope of delivery

2.2 Device description

This flowmeter can measure the flow of conductive liquids, even in partially filled pipes. To be able to do this, a capacitive height measurement has been integrated into a regular electromagnetic flowmeter. If both the filled fraction and the velocity of the fluid are known, it is easy to calculate the amount of fluid running through the pipe.

**INFORMATION!**
Product specific information and extensive product specification is available using PICK, the Product Information Center KROHNE web-tool.

PICK can be found via the service menu button on the KROHNE.com website.
2.3 Nameplates

**INFORMATION!**
Look at the device nameplate to ensure that the device is delivered according to your order. Check for the correct supply voltage printed on the nameplate.

Figure 2-2: Example of nameplate sensor

- Additional info, website and recycling logo
- CE marking with number(s) of notified body (bodies)
- Name and address of manufacturer
- Type designation with serial / CG number
- Manufacturing date and country of origin
- GK/GKL values (measuring sensor constants), size [mm/inches], field frequency
- Materials of wetted parts or the Electronic Revision number
- Electric values and protection category
- PED data type I/II/III or SEP
Electrical connection data of inputs/outputs (example of basic version)

Figure 2-4: Example of IO sticker

1. Power supply (AC: L and N, DC: L+ and L-, PE for ≥ 24V AC, FE for ≤ 24 VAC and DC)
2. Connection data of connection terminal D/D-
3. Connection data of connection terminal C/C-
4. Connection data of connection terminal B/B-
5. Connection data of connection terminal A/A-, A+ only operable in basic version

- A = active mode; the signal converter supplies the power for connection of the subsequent devices
- P = passive mode; external power supply required for operation of the subsequent devices
- N/C = connection terminals not connected
3.1 General notes on installation

INFORMATION!
Inspect the packaging carefully for damages or signs of rough handling. Report damage to the carrier and to the local office of the manufacturer.

INFORMATION!
Do a check of the packing list to make sure that you have all the elements given in the order.

INFORMATION!
Look at the device nameplate to ensure that the device is delivered according to your order. Check for the correct supply voltage printed on the nameplate.

3.2 Storage

- Store the device in a dry and dust-free location.
- Avoid lasting direct exposure to the sun.
- Store the device in its original packaging.
- Storage temperature: -50...+70°C / -58...+158°F

3.3 Transport

INFORMATION!
Inspect the packaging carefully for damages or signs of rough handling. Report damage to the carrier and to the local office of the manufacturer.

INFORMATION!
Do a check of the packing list to make sure that you have all the elements given in the order.

INFORMATION!
Look at the device nameplate to ensure that the device is delivered according to your order. Check for the correct supply voltage printed on the nameplate.

3.4 Pre-installation requirements

Make sure that you have all necessary tools available:

- Allen key (4 mm)
- Small screwdriver
- Wrench for cable glands
- Wrench for wall mounting bracket (remote version only)
- Torque wrench for installing flowmeter in pipeline

Figure 3-1: Transport
3.5 General requirements

INFORMATION!
The following precautions must be taken to ensure reliable installation.

- Make sure that there is adequate space to the sides.
- Protect the signal converter from direct sunlight and install a sun shade if necessary.
- Signal converters installed in control cabinets require adequate cooling, e.g. by fan or heat exchanger.
- Do not expose the signal converter to intense vibration. The flowmeters are tested for a vibration level in accordance with IEC 68-2-64.

3.5.1 Vibration

![Avoid vibrations](image1)

Figure 3-2: Avoid vibrations

3.5.2 Magnetic field

![Avoid magnetic fields](image2)

Figure 3-3: Avoid magnetic fields
3.6 Installation conditions

3.6.1 Inlet and outlet

![Figure 3-4: Recommended inlet and outlet sections, top view](image)

- ① ≥ 5 DN
- ② ≥ 3 DN

3.6.2 Control valve

![Figure 3-5: Installation before control valve](image)

3.6.3 Slope

**CAUTION!**
The accuracy is influenced by the slope. Stay within ±1% to get the most accurate measurements!

![Figure 3-6: Recommended slope](image)
3.6.4 Mounting advice for difficult situations

If you can not meet the installation conditions install the flowmeter between two containers. The inlet to the flowmeter must be higher than the outlet of the fluid. In this way you will have a calm flow into the flowmeter, resulting in a highly accurate measurement. The sizes of the containers must be proportional to the size of the flowmeter.

![Figure 3-7: Installing in difficult situations](image)

1. Use a container if the Inlet pipe has a slope > 1%. Make sure that the outlet level of this pipe is below the inlet to the flowmeter.
2. Inlet container
3. Inlet section of 10 DN
4. Outlet section of 5 DN
5. Outlet container advisable if outlet pipe has a slope > 1%.

**CAUTION!**
Always use a free exit pipe to prevent backflow in the flow sensor and to keep the velocity at the maximum flow at least at 1 m/s.

3.6.5 Open discharge

![Figure 3-8: Open discharge](image)

1. ≥ 5 DN
2. Make sure that the water level stays below the pipe outlet.
3.6.6 Cleaning of flow sensor

The flow sensor is highly resistant against dirt and the measurement will rarely be influenced by anything. However, it is advisable to create a possibility for cleaning just in front or behind the sensor.

![Cleaning of flow sensor](image1)

**Figure 3-9: Option for cleaning of flow sensor**

1. Opening for cleaning

3.6.7 Flange deviation

**CAUTION!**

*Max. permissible deviation of pipe flange faces:
\[ L_{\text{max}} - L_{\text{min}} \leq 0.5 \text{ mm} / 0.02" \]

![Flange deviation](image2)

**Figure 3-10: Flange deviation**

1. \( L_{\text{max}} \)
2. \( L_{\text{min}} \)
3.6.8 Mounting position

**CAUTION!**

*Only install the flow sensor in the shown position to keep the electrodes under water. Limit the rotation to ±2° to maintain the accuracy.*

![Figure 3-11: Mounting position](image1)

3.6.9 Torques and pressures

**Tightening of bolts**

- Always tighten the bolts uniformly and in diagonally opposite sequence.
- Do not exceed the maximum torque value.
- Step 1: Apply approx. 50% of max. torque given in table.
- Step 2: Apply approx. 80% of max. torque given in table.
- Step 3: Apply 100% of max. torque given in table.
**INFORMATION!**
Tighten the bolts uniformly in diagonally opposite sequence.

**INFORMATION!**
Information for bigger sizes is available on request.
4.1 Safety instructions

DANGER!
All work on the electrical connections may only be carried out with the power disconnected. Take note of the voltage data on the nameplate!

DANGER!
Observe the national regulations for electrical installations!

WARNING!
Observe without fail the local occupational health and safety regulations. Any work done on the electrical components of the measuring device may only be carried out by properly trained specialists.

INFORMATION!
Look at the device nameplate to ensure that the device is delivered according to your order. Check for the correct supply voltage printed on the nameplate.

4.2 Important notes on electrical connection

DANGER!
Electrical connection is carried out in conformity with the VDE 0100 directive “Regulations for electrical power installations with line voltages up to 1000 V” or equivalent national regulations.

CAUTION!
• Use suitable cable entries for the various electrical cables.
• The sensor and converter are configured together in the factory. For this reason, please connect the devices in pairs. Ensure that the sensor constant GK [see nameplates] are identically set.
• The TIDALFLUX 2300 sensor and converter need both a separate power supply.

INFORMATION!
For more information about the grounding of the flowmeter, refer to Grounding on page 36.
4.3 Connection of cables

The illustration shows the different connections and cable entries. View “p” shows [explicit] the bottom entries for signal and field current cables into the connection box on the signal converter.

**INFORMATION!**
For more detailed information refer to the following electrical diagrams and illustrations in the TIDALFLUX 2300 manual.

![Figure 4-1: Cable entries for electrical connection](image-url)

1. View “p” of the connection box of the signal converter
2. Field current cable
3. Signal cable (DS or BTS)
4. Interface cable
5. Flow sensor
INFORMATION!
The next drawing shows the situation for a signal cable type BTS. In case of a signal cable type DS, terminals 20 and 30 are not used.

Figure 4-2: Connection diagram
1. Connection box of signal converter
2. I/O connection box of flow sensor
3. Connection box of flow sensor
4. Connect the outer screens via strain reliefs
5. Labelled wires for connection on terminals E-C-D in connection box
4.3.1 Cable lengths

**CAUTION!**
The maximum allowed distance between the flow sensor and the converter is determined by the shortest cable length.

**Interface cable**: maximum length is 600 m / 1968 ft.

**Type B (BTS) signal cable**: maximum length is 600 m / 1968 ft.

**Type A (DS) signal cable**: maximum length depends on the conductivity of the fluid:

<table>
<thead>
<tr>
<th>Electrical conductivity</th>
<th>Maximum length</th>
</tr>
</thead>
<tbody>
<tr>
<td>[μS/cm]</td>
<td>[m]</td>
</tr>
<tr>
<td>50</td>

Figure 4-4: Connection diagram for signal cable type B (BTS)
1. Connection box of converter
2. I/O connection box of sensor
3. Connection box of sensor
4. Connect the outer screens via strain reliefs
4.3.3 Connection of TIDALFLUX 2000 F

The flow sensor and the signal converter must be incorporated in the equipotential bonding system of the installation. This can be established internally by connection of the protective earth (PE) conductor of the mains supply system to the internal PE clamp, or externally, by connecting a separate equipotential bonding conductor between the two external PE-clamps (size M5). A separate bonding conductor must have a cross-sectional area of at least 4 mm².

Keep the screw-threads free of dirt and well-greased (e.g. with PTFE grease). The grease will help to prevent the threads from locking due to corrosion.

To unscrew the covers, first release the interlocking devices (one at each cover). Therefore unscrew the M4 head screw with an internal hexagon socket set using a HEX or Allen key no. 2.5 until the interlocking device can be turned. After the covers are screwed back onto the housing, make sure that the interlocking devices are properly refitted.

CAUTION!
The TIDALFLUX 2300 sensor and converter need both a separate power supply.

4.3.4 Connection box TIDALFLUX 2000

The connection box of the TIDALFLUX 2000 is positioned below the "double housing". Here the signal- and field current cables have to be lead through and the separate wires must be connected on the contacts as described in the illustration below (see also table "Description of connections").

![Electrical connections diagram]

4.3.5 Connection of IFC 300 F / PF

The flow sensor and the signal converter must be incorporated in the equipotential bonding system of the installation. This can be established internally by connection of the protective earth (PE) conductor of the mains supply system to the internal PE clamp, or externally, by connecting a separate equipotential bonding conductor between the two external PE-clamps [size M5]. A separate bonding conductor must have a cross-sectional area of at least 4 mm².

Keep the screw-threads free of dirt and well-greased [e.g. with PTFE grease]. The grease will help to prevent the threads from locking due to corrosion.

To unscrew the covers, first release the interlocking devices (one at each cover). Therefore unscrew the M4 head screw with an internal hexagon socket set using a HEX or Allen key no. 2.5 until the interlocking device can be turned. After the covers are screwed back onto the housing, make sure that the interlocking devices are properly refitted.

4.4 Signal cable B (type BTS 300), construction

- Signal cable B is a triple-shielded cable for signal transmission between the flow sensor and signal converter.
- Bending radius: ≥ 50 mm / 2"

![Figure 4-11: Construction of signal cable B](image)

1. Stranded drain wire for the inner shield (10), 1.0 mm² Cu / AWG 17 [not insulated, bare]
2. Insulated wire (2), 0.5 mm² Cu / AWG 20 with stranded drain wire (20) of shield
3. Insulated wire (3), 0.5 mm² Cu / AWG 20 with stranded drain wire (30) of shield
4. Outer sheath
5. Insulation layers
6. Stranded drain wire (6) for the outer shield (60), 0.5 mm² Cu / AWG 20 [not insulated, bare]

4.5 Signal cable A (type DS 300), construction

- Signal cable A is a double-shielded cable for signal transmission between the flow sensor and signal converter.
- Bending radius: ≥ 50 mm / 2"

![Figure 4-12: Construction of signal cable A](image)

1. Stranded drain wire (1) for the inner shield (10), 1.0 mm² Cu / AWG 17 [not insulated, bare]
2. Insulated wire (2), 0.5 mm² Cu / AWG 20
3. Insulated wire (3), 0.5 mm² Cu / AWG 20
4. Outer sheath
5. Insulation layers
6. Stranded drain wire (6) for the outer shield (60)
4.6 Prepare signal cable A, connect to flow sensor

**INFORMATION!**
Assembly materials and tools are not part of the delivery. Use the assembly materials and tools in compliance with the applicable occupational health and safety directives.

**Required materials**
- PVC insulating tube, Ø2.0...2.5 mm / 0.08...0.1”
- Heat-shrinkable tubing
- Wire end ferrule to DIN 46 228: E 1.5-8 for the twisted stranded drain wires [1] and [6]
- 2x wire end ferrules to DIN 46 228: E 0.5-8 for the insulated conductors [2, 3]

![Diagram of electrical connections](image-url)

**Figure 4-13: Prepare signal cable A, connect to flow sensor**

a = 50 mm / 2”

1. Strip the conductor to dimension a.
2. Cut the outer shields [60] and [10]. Make sure not to damage the stranded drain wires [1] and [6].
4. Slide an insulating tube over the stranded drain wires [1] and [6].
5. Crimp the wire end ferrules onto conductors 2 and 3 and the stranded drain wires [1] and [6].
6. Pull the heat-shrinkable tubing over the prepared signal cable.
4.7 Preparing signal cable B, connection to flow sensor

**INFORMATION!**
Assembly materials and tools are not part of the delivery. Use the assembly materials and tools in compliance with the applicable occupational health and safety directives.

**Required materials**
- PVC insulating tube, Ø2.0...2.5 mm / 0.08...0.1"
- Heat-shrinkable tubing
- Wire end ferrule to DIN 46 228: E 1.5-8 for the twisted stranded drain wires (1) and (6)
- 2x wire end ferrules to DIN 46 228: E 0.5-8 for the insulated conductors (2, 3)

1. Strip the conductor to dimension a.
2. Cut the outer shields (60), (10), the shields around the insulated conductors (2, 3) and the stranded drain wires (20, 30). Make sure not to damage the stranded drain wires (1) and (6).
3. Twist the stranded drain wires (6) of the outer shield and the drain wire (1) of the inner shield (10).
4. Slide an insulating tube over the stranded drain wires (1) and (6).
5. Crimp the wire end ferrules onto conductors 2 and 3 and the stranded drain wires (1) and (6).
6. Pull the heat-shrinkable tubing over the prepared signal cable.

Figure 4-14: Preparing signal cable B, connection to flow sensor
a = 50 mm / 2"
4.8 Preparing field current cable C, connection to flow sensor

**INFORMATION!**
Assembly materials and tools are not part of the delivery. Use the assembly materials and tools in compliance with the applicable occupational health and safety directives.

- The field current cable is not part of the scope of delivery.
- The shield is connected in the terminal compartment of the signal converter directly via the shield and a clip.
- The shield is connected in the flow sensor via the special cable gland.
- Bending radius: $\geq 50 \text{ mm} / 2^\prime$

**Required materials**
- Shielded 2-wire insulated copper cable
- Insulating tube, size according to the cable being used
- Heat-shrinkable tubing
- DIN 46 228 wire end ferrules: size according to the cable being used

---

**Figure 4-15: Preparation of field current cable C**

a = 125 mm / 5"

b = 10 mm / 0.4"

1. Strip the conductor to dimension a.
2. Trim the outer shield to dimension b and pull it over the outer sheath.
3. Crimp wire end ferrules onto both conductors.
4.9 Interface cable

The data interface cable is a shielded, 3 x 1.5 mm² LIYC cable.

Preparing the interface cable

Strip the conductor to dimension a.

Trim the outer shield to dimension b and pull it over the outer sheath.

Crimp the wire end ferrules onto the conductors 1, 2 and 3.

Connect the shielding at both sides of the cable via the special cable gland.

At signal converter side:

Connecting shielding under clamp in connection box of converter

4. Isolation
5. Feed cable through dome nut and clamping insert and fold shielding over clamping insert. Make sure that the braided shield overlaps the O-ring by 2 mm / 3/32”.
6. Push clamping insert into body.
7. Tighten the dome nut.
4.10 Grounding

**DANGER!**
The device must be grounded in accordance with regulations in order to protect personnel against electric shocks.

### 4.10.1 Mounting grounding rings

**CAUTION!**
In order to get a reliable height measurement it is absolutely necessary that the inner side of the connecting pipeline is electrically conductive and connected to ground. If not, tailor-made grounding rings with a cylindrical part can be delivered. Please contact your local agency in case of doubt.

![Figure 4-19: Grounding with grounding rings](image)

1. Existing pipeline
2. Grounding rings, custom made to inner diameter of pipeline
3. TIDALFLUX
4. Insert the cylindrical part of the grounding ring into the pipeline. Use an appropriate gasket between the grounding ring and the flange.

**INFORMATION!**
Sizes of the grounding rings are diameter dependent and available on request.

### 4.11 Before switching on the power

Before switching on the power, please check that the system has been correctly installed. This includes:

- The device must be mechanically mounted safely in compliance with the regulations.
- The power connections must be in compliance with the regulations.
- Make sure that all electrical connections are made and that the covers of the terminal compartments are closed.
- Check that the electrical operating data of the power supply are correct.

- Switch on the power.

**INFORMATION!**
The sensor can not be programmed or changed in any way. All settable functions are included in the converter. Please see the relevant documentation of the converter for more information.
5.1 Spare parts availability

The manufacturer adheres to the basic principle that functionally adequate spare parts for each device or each important accessory part will be kept available for a period of 3 years after delivery of the last production run for the device.

This regulation only applies to spare parts which are subject to wear and tear under normal operating conditions.

5.2 Availability of services

The manufacturer offers a range of services to support the customer after expiration of the warranty. These include repair, maintenance, technical support and training.

INFORMATION!
For more precise information, please contact your local sales office.

5.3 Returning the device to the manufacturer

5.3.1 General information

This device has been carefully manufactured and tested. If installed and operated in accordance with these operating instructions, it will rarely present any problems.

WARNING!
Should you nevertheless need to return a device for inspection or repair, please pay strict attention to the following points:
- Due to statutory regulations on environmental protection and safeguarding the health and safety of the personnel, the manufacturer may only handle, test and repair returned devices that have been in contact with products without risk to personnel and environment.
- This means that the manufacturer can only service this device if it is accompanied by the following certificate [see next section] confirming that the device is safe to handle.

WARNING!
If the device has been operated with toxic, caustic, radioactive, flammable or water-endangering products, you are kindly requested:
- to check and ensure, if necessary by rinsing or neutralising, that all cavities are free from such dangerous substances,
- to enclose a certificate with the device confirming that it is safe to handle and stating the product used.
5.3.2 Form (for copying) to accompany a returned device

**CAUTION!**
To avoid any risk for our service personnel, this form has to be accessible from outside of the packaging with the returned device.

<table>
<thead>
<tr>
<th>Company:</th>
<th>Address:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Department:</td>
<td>Name:</td>
</tr>
<tr>
<td>Tel. no.:</td>
<td>Fax no. and/or Email address:</td>
</tr>
</tbody>
</table>

Manufacturer’s order no. or serial no.:

The device has been operated with the following medium:

This medium is:
- radioactive
- water-hazardous
- toxic
- caustic
- flammable

We checked that all cavities in the device are free from such substances.
We have flushed out and neutralized all cavities in the device.

We hereby confirm that there is no risk to persons or the environment through any residual media contained in the device when it is returned.

Signature:  
Stamp:

5.4 Disposal

**LEGAL NOTICE!**
Disposal must be carried out in accordance with legislation applicable in your country.

Separate collection of WEEE (Waste Electrical and Electronic Equipment) in the European Union:

According to the directive 2012/19/EU, the monitoring and control instruments marked with the WEEE symbol and reaching their end-of-life must not be disposed of with other waste. The user must dispose of the WEEE to a designated collection point for the recycling of WEEE or send them back to our local organisation or authorised representative.
6.1 Measuring principle

The TIDALFLUX 2000 is an electromagnetic flow sensor with an integrated capacitive level measurement system, designed for electrically conductive process liquids. The flow rate \( Q(t) \) through the tube is: 
\[
Q(t) = v(t) \times A(t)
\]
in which
\( v(t) \) = flow velocity of liquid product
\( A(t) \) = wetted area of tube section.

The flow velocity is determined on the basis of the known electromagnetic measurement principle. The two measuring electrodes are located in the lower part of the measuring tube, on a level of approx. 10% of the inner diameter of the pipe in order to get a reliable measurement up from a level of 10%.

An electrically conductive fluid flows inside an electrically insulated pipe through a magnetic field. This magnetic field is generated by a current, flowing through a pair of field coils. Inside of the fluid, a voltage \( U \) is generated:
\[
U = v \times k \times B \times D
\]
in which:
\( v \) = mean flow velocity
\( k \) = factor correcting for geometry
\( B \) = magnetic field strength
\( D \) = distance between electrodes

The signal voltage \( U \) is picked off by electrodes and is proportional to the mean flow velocity \( v \) and thus the flow rate \( q \). The signal voltage is quite small (typically 1 mV at \( v = 3 \) m/s / 10 ft/s and field coil power of 1 W). Finally, a signal converter is used to amplify the signal voltage, filter it (separate from noise) and convert it into signals for totalising, recording and output processing.

The wetted area \( A \) is computed from the known inside diameter of the pipe by the patented capacitive level measurement system that is built into the measuring tube liner. The required electronics unit is accommodated in a compact housing that is mounted on top of the measuring sensor. This electronics is connected to the remote IFC 300 F converter by means of a digital communication line.
6.2 Technical data

INFORMATION!
- The following data is provided for general applications. If you require data that is more relevant to your specific application, please contact us or your local sales office.
- Additional information (certificates, special tools, software,...) and complete product documentation can be downloaded free of charge from the website [Downloadcenter].

6.3 Sizing

**INFORMATION!**
These tables state the flow rate in a partially filled pipe, dependant on the slope, filling level, inner diameter and friction factors of the pipe. The values are calculated according to the Manning-Strickler equation. The results do not consider deposits, profile distortion, backwater, the friction of air and the slightly smaller inner diameter of the TIDALFLUX.

</table>
EXAMPLE:
Consider a maximum flow to be measured of 1200 m³/h. The material of the pipeline is steel and the slope 1.0%.

From the table, a maximum flow has to be selected that is bigger than the flow to be measured. Selection: DN500, Q_max = 1767 m³/h and v_max = 2.5 m/s.

To determine the level in the pipe at 1200 m³/h, calculated the ratio Q / Q_max = 1200 / 1767 = 0.68. See the above figure and read out the ratio’s of H/DN and v/v_max:
① H/DN = 0.6 or 0.6 x 500 mm = 300 mm,
② At H/DN = 0.6, find v/v_max = 1.05, so v = 1.05 x 2.5 = 2.63 m/s.

INFORMATION!
Q_max and v_max are the values of Q and v if the pipe is completely filled

INFORMATION!
A sizing tool for various slopes is available at the website of the manufacturer.
6.4 Measuring accuracy

Every electromagnetic flowmeter is calibrated by direct volume comparison. The wet calibration validates the performance of the flowmeter under reference conditions against accuracy limits.

The accuracy limits of electromagnetic flowmeters are typically the result of the combined effect of linearity, zero point stability and calibration uncertainty.

Reference conditions
- Medium: water
- Temperature: +5...35°C / +41...95°F
- Operating pressure: 0.1...5 barg / 1.5...72.5 psig
- Inlet section: ≥ 10 DN
- Outlet section: ≥ 5 DN

The measuring accuracy for partly filled pipes and completely filled pipes are different. In these graphs it is assumed that the velocity at full scale value is at least 1 m/s (is also the standard value for calibration, since it will result in the most accurate measurements). Additional conditions; slope of pipe line 0%, electrical conductivity medium 50...5000 μS/cm.

Partly filled:
- \( v \) @ Full Scale ≥ 1 m/s / 3.3 ft/s: ≤ 1% of Full Scale

Fully filled:
- \( v \) ≥ 1 m/s / 3.3 ft/s: ≤ 1% of MV
- \( v \) < 1 m/s / 3.3 ft/s: ≤ 0.5% of MV + 5 mm/s / 0.2 inch/s (see following graph)

Fully filled pipes

![Figure 6-3: Maximum measuring error of measured value (=Y)](image-url)
6.5 Dimensions and weights

The inner pipe diameter should match the inner diameter of the flowmeter. Since the inner diameter is not a standard DN size, choose the inner pipe diameter to be just a little bit bigger than the flowmeter diameter. If a lot of sediment or fat is expected the optimal solution is to use a customized diameter compensation ring on both sides to have smooth transits.

**INFORMATION!**
Detailed 2D and 3D drawings are available on the website of the manufacturer.

**EN 1092-1**
