# 1 About this document

# 1.1 Function

This instruction provides all the information you need for mounting, connection and setup as well as important instructions for maintenance, fault rectification, the exchange of parts and the safety of the user. Please read this information before putting the instrument into operation and keep this manual accessible in the immediate vicinity of the device.

# 1.2 Target group

This operating instructions manual is directed to trained personnel. The contents of this manual must be made available to the qualified personnel and implemented.

# 1.3 Symbols used

**Information, note, tip:** This symbol indicates helpful additional information and tips for successful work.

**Note:** This symbol indicates notes to prevent failures, malfunctions, damage to devices or plants.

**Caution:** Non-observance of the information marked with this symbol may result in personal injury.

**Warning:** Non-observance of the information marked with this symbol may result in serious or fatal personal injury.

**Danger:** Non-observance of the information marked with this symbol results in serious or fatal personal injury.

### Ex applications

This symbol indicates special instructions for Ex applications.

List

The dot set in front indicates a list with no implied sequence.

1 Sequence of actions

Numbers set in front indicate successive steps in a procedure.

### Battery disposal

This symbol indicates special information about the disposal of batteries and accumulators.

# 2 For your safety

### 2.1 Authorised personnel

All operations described in this documentation must be carried out only by trained, qualified personnel authorised by the plant operator.

During work on and with the device, the required personal protective equipment must always be worn.

# 2.2 Appropriate use

OPTISOUND 3030 C is a sensor for continuous level measurement.

You can find detailed information about the area of application in chapter "*Product description*".

Operational reliability is ensured only if the instrument is properly used according to the specifications in the operating instructions manual as well as possible supplementary instructions.

# 2.3 Warning about incorrect use

Inappropriate or incorrect use of this product can give rise to application-specific hazards, e.g. vessel overfill through incorrect mounting or adjustment. Damage to property and persons or environmental contamination can result. Also, the protective characteristics of the instrument can be impaired.

# 2.4 General safety instructions

This is a state-of-the-art instrument complying with all prevailing regulations and directives. The instrument must only be operated in a technically flawless and reliable condition. The operator is responsible for the trouble-free operation of the instrument. When measuring aggressive or corrosive media that can cause a dangerous situation if the instrument malfunctions, the operator has to implement suitable measures to make sure the instrument is functioning properly.

The safety instructions in this operating instructions manual, the national installation standards as well as the valid safety regulations and accident prevention rules must be observed by the user.

For safety and warranty reasons, any invasive work on the device beyond that described in the operating instructions manual may be carried out only by personnel authorised by the manufacturer. Arbitrary conversions or modifications are explicitly forbidden. For safety reasons, only the accessory specified by the manufacturer must be used.

To avoid any danger, the safety approval markings and safety tips on the device must also be observed.

# 2.5 Safety label on the instrument

The safety approval markings and safety tips on the device must be observed.

# 2.6 EU conformity

The device fulfils the legal requirements of the applicable EU directives. By affixing the CE marking, we confirm the conformity of the instrument with these directives.

The EU conformity declaration can be found on our homepage.

#### Electromagnetic compatibility

The instruments are designed for use in an industrial environment. Nevertheless, electromagnetic interference from electrical conductors and radiated emissions must be taken into account, as is usual with a class A instrument according to EN 61326-1. If the instrument is used in a different environment, its electromagnetic compatibility with other devices must be ensured by suitable measures.

# 2.7 Fulfillment of NAMUR recommendations

NAMUR is the automation technology user association in the process industry in Germany. The published NAMUR recommendations are accepted as the standard in field instrumentation.

The device fulfils the requirements of the following NAMUR recommendations:

- NE 21: 2012 Electromagnetic compatibility of equipment
- NE 43 Signal level for fault information from measuring transducers
- NE 53 Compatibility of field devices and display/adjustment components

For further information see www.namur.de.

# 2.8 Installation and operation in the USA and Canada

This information is only valid for USA and Canada. Hence the following text is only available in the English language.

Installations in the US shall comply with the relevant requirements of the National Electrical Code (ANSI/NFPA 70).

Installations in Canada shall comply with the relevant requirements of the Canadian Electrical Code.

Scope of delivery

# 3 Product description

# 3.1 Configuration

The scope of delivery encompasses:

- OPTISOUND 3030 C ultrasonic sensor
- Optionally mounting strap or compression flange
- Documentation
  - This operating instructions manual
  - Ex-specific afety instructions (with Ex versions)
  - Operating instructions "Display and adjustment module" (optional)
  - If necessary, further certificates

### Information:

Optional instrument features are also described in this operating instructions manual. The respective scope of delivery results from the order specification.

# Constituent parts

The OPTISOUND 3030 C consists of the components:

- Process fitting with transducer
- Housing with electronics
- Housing lid with integrated display and adjustment module (optional)

The components are available in different versions.

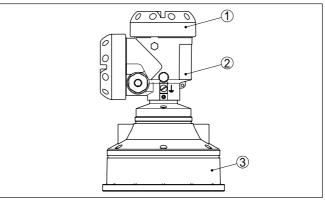

Fig. 1: OPTISOUND 3030 C, Aluminium double chamber housing

- 1 Housing lid with integrated display and adjustment module (optional)
- 2 Housing with electronics
- 3 Process fitting with transducer

Type label

30512-EN-210701

The type label contains the most important data for identification and use of the instrument:

- Instrument type
- Article and serial number device
- Article numbers, documentation

|                      | • Technical data: For example approvals, process temperature, process fitting/material, signal output, voltage supply, protection   |
|----------------------|---|
|                      | 3.2 Principle of operation  |
| Application area     | OPTISOUND 3030 C is an ultrasonic sensor for continuous level<br>measurement. It is suitable for liquids and solids in practically all<br>industries.   |
| Functional principle | The transducer of the ultrasonic sensor transmits short ultrasonic<br>pulses to the measured product. These pulses are reflected by<br>medium surface and received back by the transducer as echoes.<br>The running time of the ultrasonic pulses from emission to reception<br>is proportional to the distance and hence the level. The determined<br>level is converted into an appropriate output signal and outputted as<br>measured value. |
| Voltage supply       | Four-wire electronics with separate power supply.   |
|                      | The supply voltage range can differ depending on the instrument version.  |
|                      | The data for power supply are specified in chapter "Technical data".  |
|                      | Measured value transmission is carried out via the 4 20 mA/HART output separate from power supply.  |
|                      | 3.3 Packaging, transport and storage  |
| Packaging            | Your instrument was protected by packaging during transport. Its<br>capacity to handle normal loads during transport is assured by a test<br>based on ISO 4180.   |
|                      | The packaging of standard instruments consists of environment-<br>friendly, recyclable cardboard. For special versions, PE foam or PE<br>foil is also used. Dispose of the packaging material via specialised<br>recycling companies.   |
| Transport            | Transport must be carried out in due consideration of the notes on the transport packaging. Nonobservance of these instructions can cause damage to the device.   |
| Transport inspection | The delivery must be checked for completeness and possible transit damage immediately at receipt. Ascertained transit damage or concealed defects must be appropriately dealt with.   |
| Storage              | Up to the time of installation, the packages must be left closed and stored according to the orientation and storage markings on the outside.   |
|                      | Unless otherwise indicated, the packages must be stored only under<br>the following conditions:   |
|                      | Not in the open   |
|                      | <ul> <li>Dry and dust free</li> <li>Not exposed to corrosive media</li> <li>Protected against solar radiation</li> </ul>  |
|                      |   |

| Storage and transport temperature | <ul> <li>Avoiding mechanical shock and vibration</li> <li>Storage and transport temperature see chapter " Supplement -<br/>Tacknical data Ambient and diaga"</li> </ul> |
|-----------------------------------|---|
| temperature                       | <ul> <li>Technical data - Ambient conditions"</li> <li>Relative humidity 20 85 %</li> </ul>   |
| Lifting and carrying              | With instrument weights of more than 18 kg (39.68 lbs) suitable and approved equipment must be used for lifting and carrying.   |

Moisture

# 4 Mounting

# 4.1 General instructions

Installation position

Select an installation position you can easily reach for mounting and connecting as well as later retrofitting of a display and adjustment module. The housing can be rotated by 330° without the use of any tools. You can also install the display and adjustment module in four different positions (each displaced by 90°).

Use the recommended cables (see chapter " *Connecting to power supply*") and tighten the cable gland.

You can give your instrument additional protection against moisture penetration by leading the connection cable downward in front of the cable gland. Rain and condensation water can thus drain off. This applies mainly to outdoor mounting as well as installation in areas where high humidity is expected (e.g. through cleaning processes) or on cooled or heated vessels.

To maintain the housing protection, make sure that the housing lid is closed during operation and locked, if necessary.

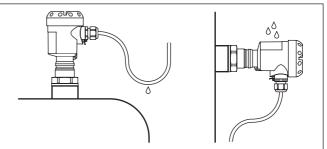

Fig. 2: Measures against moisture ingress

| Cable entries - NPT<br>thread<br>Cable glands | <b>Metric threads</b><br>In the case of instrument housings with metric thread, the cable<br>glands are screwed in at the factory. They are sealed with plastic<br>plugs as transport protection.   |
|---|---|
|   | You have to remove these plugs before electrical connection.  |
|   | <b>NPT thread</b><br>In the case of instrument housings with self-sealing NPT threads, it is<br>not possible to have the cable entries screwed in at the factory. The<br>free openings for the cable glands are therefore covered with red dust<br>protection caps as transport protection. |
|   | Prior to setup you have to replace these protective caps with approved cable glands or close the openings with suitable blind plugs.  |
| Measuring range                               | The reference plane for the measuring range is the lower edge of the transducer.  |
|   | Make sure that a minimum distance from the reference plane - the so-called dead zone, in which measurement is not possible - is   |

maintained. The exact value of the dead zone is stated in chapter "Technical data".

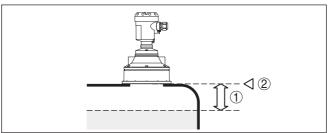

Fig. 3: Minimum distance to the max. level

- 1 Dead zone
- 2 Reference plane

### Information:

If the medium reaches the transducer, buildup can form on it and cause faulty measurements later on.

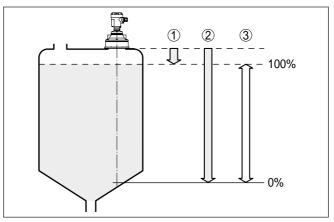

Fig. 4: Measuring range (operating range) and max. measuring distance

- 1 full
- 2 empty (max. measuring distance)
- 3 Measuring range

Pressure/Vacuum

Installation position

Gauge pressure in the vessel does not influence OPTISOUND 3030 C. Low pressure or vacuum does, however, damp the ultrasonic pulses. This influences the measuring result, particularly if the level is very low. With pressures under -0.2 bar (-20 kPa) you should use a different measuring principle, e.g. radar or guided radar (TDR).

# 4.2 Mounting instructions

When mounting the OPTISOUND 3030 C, keep a distance of at least 200 mm (7.874 in) to the vessel wall. If the sensor is installed in the center of dished or round vessel tops, multiple echoes can arise.

These can, however, be suppressed by an appropriate adjustment (see chapter "*Setup*").

If this distance cannot be maintained, a false signal suppression should be carried out during setup. This applies particularly if buildup on the vessel wall is expected. In such cases, we recommend repeating the false signal suppression at a later date with existing buildup.

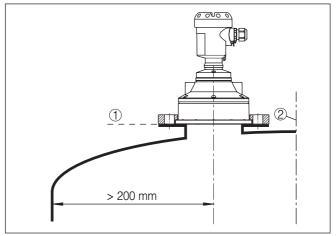

Fig. 5: Mounting on round vessel tops

- 1 Reference plane
- 2 Vessel center or symmetry axis

In vessels with conical bottom it can be advantageous to mount the sensor in the centre of the vessel, as measurement is then possible down to the bottom.

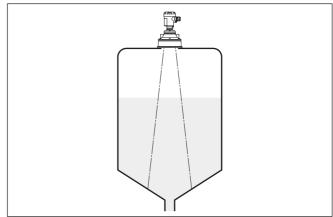

Fig. 6: Vessel with conical bottom

Mounting socket

Preferably the transducer should be mounted flush to the vessel top.

If the reflective properties of the medium are good, you can mount OPTISOUND 3030 C on a socket piece. You will find recommended values for socket heights in the following illustration. The socket end should be smooth and burr-free, if possible also rounded. Carry out a false signal suppression.

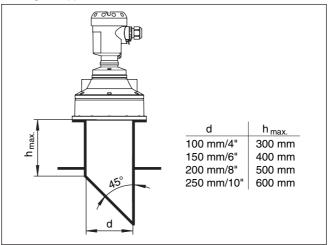

Fig. 7: Deviating socket dimensions

### Sensor orientation

In liquids, direct the sensor as perpendicular as possible to the medium surface to achieve optimum measurement results.

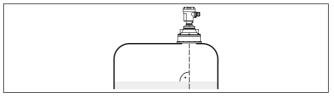

Fig. 8: Alignment in liquids

To optimally align the sensor to solid products, a swivelling holder (mounting strap) can be implemented.

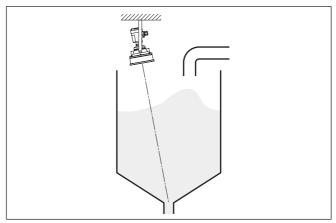

Fig. 9: Orientation in solids

To reduce the min. distance to the medium, you can also mount OP-TISOUND 3030 C with a beam deflector. By doing this, it is possible to fill the vessel nearly to maximum. Such an arrangement is suitable primarily for open vessels such as e.g. overflow basins.

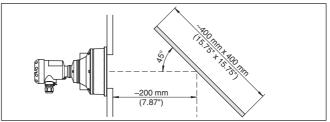

Fig. 10: Beam deflector

#### Vessel installations

The ultrasonic sensor should be installed at a location where no installations cross the ultrasonic beam.

Vessel installations such as for example, ladders, limit switches, heating spirals, struts etc. can cause false echoes that interfere with the useful echo. Make sure when planning your measuring site that the ultrasonic signals have a "clear view" to the measured product.

In case of existing vessel installations, a false signal suppression should be carried out during setup.

If large vessel installations such as struts or supports cause false echoes, these can be attenuated through supplementary measures. Small, inclined sheet metal or plastic baffles above the installations scatter the ultrasonic signals and avoid direct false echoes.

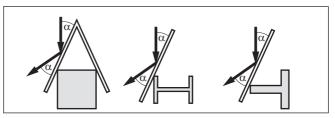

Fig. 11: Cover flat, large-area profiles with deflectors

#### Agitators

If there are agitators in the vessel, a false signal suppression should be carried out with the agitators in motion. This ensures that the interfering reflections from the agitators are saved with the blades in different positions.

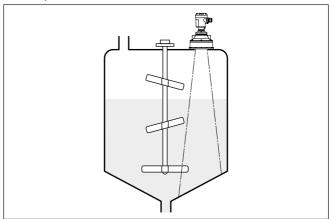

Fig. 12: Agitators

#### Inflowing medium

Do not mount the instruments in or above the filling stream. Make sure that you detect the medium surface, not the inflowing product.

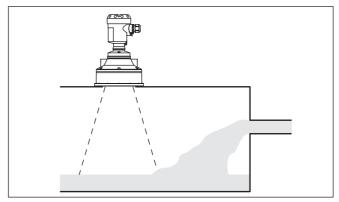

Fig. 13: Inflowing liquid

| Foam                  | Through the action of filling, stirring and other processes in the vessel, dense foams which considerably damp the emitted signals may form on the medium surface.  |
|-----------------------|---|
|                       | If foams are causing measurement errors, the sensor should be used<br>in a standpipe or, alternatively, the more suitable guided radar sen-<br>sors (TDR) should be used.   |
|                       | Guided wave radar is unaffected by foam generation and is particu-<br>larly suitable for such applications.   |
| Air turbulences       | If there are strong air currents in the vessel, e.g. due to strong winds<br>in outdoor installations or air turbulence, e.g. by cyclone extraction<br>you should mount OPTISOUND 3030 C in a standpipe or use a differ-<br>ent measuring principle, e.g. radar or guided radar (TDR). |
| Standpipe measurement | By using a standpipe (surge or bypass tube), the influence of vessel installations, foam generation and turbulence is excluded.   |
|                       | Standpipes must extend all the way down to the requested min. level, as measurement is only possible within the tube.   |

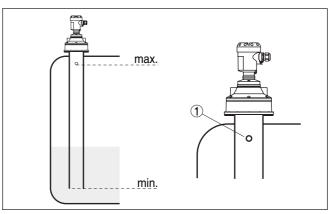

Fig. 14: Standpipe in the tank

1 Vent hole ø 5 ... 10 mm

OPTISOUND 3030 C can be used from tube diameters of 100 mm.

Avoid large gaps and thick welding joints when connecting the tubes. Generally carry out a false signal suppression.

Measurement in a standpipe is not recommended for adhesive products.

5

|                     |          | 5   |
|---------------------|----------|---|
| Safety instructions |          | <b>5.1 Preparing the connection</b><br>Always keep in mind the following safety instructions:   |
|                     | $\wedge$ | Warning:<br>Connect only in the complete absence of line voltage.   |
|                     |          | <ul> <li>The electrical connection must only be carried out by trained, qualified personnel authorised by the plant operator.</li> <li>If overvoltage surges are expected, overvoltage arresters should be installed.</li> </ul>            |
|                     | i        | <b>Note:</b><br>Install a disconnecting device for the instrument which is easy to access. The disconnecting device must be marked for the instrument (IEC/EN 61010).   |
| Voltage supply      |          | Supply voltage and current output are carried on separate two-wire connection cables if reliable separation is required. The supply voltage range can differ depending on the instrument version.   |
|                     |          | The data for power supply are specified in chapter "Technical data".  |
|                     |          | The standard version can be operated with an earth-connected cur-<br>rent output, the Exd version must be operated with a floating output.  |
|                     |          | This instrument is designed in protection class I. To maintain this protection class, it is absolutely necessary that the ground conductor be connected to the internal ground terminal. Take note of the general installation regulations. |
|                     |          | Always connect the instrument to vessel ground (potential equalisa-<br>tion) or in case of plastic vessels to the next ground potential. For<br>this purpose there is a ground terminal on the side of the instrument<br>housing.           |
| Connection cable    |          | For voltage supply, an approved installation cable with PE conductor is required.   |
|                     |          | The 4 20 mA current output is connected with standard two-wire cable without screening. If electromagnetic interference is expected which is above the test values of EN 61326-1 for industrial areas, screened cable should be used.       |
|                     |          | Make sure that the cable used has the required temperature resist-<br>ance and fire safety for max. occurring ambient temperature   |
|                     |          | Use cable with round cross section for instruments with housing and cable gland. To ensure the seal effect of the cable gland (IP protection rating), find out which cable outer diameter the cable gland is suitable for.                  |
|                     |          | Use a cable gland fitting the cable diameter.   |

Connecting to power supply

Use a cable gland fitting the cable diameter.

Cable screening and If screened cable is required, we recommend connecting the cable grounding screen on both ends to ground potential. In the sensor, the screening must be connected directly to the internal ground terminal. The

ground terminal on the outside of the housing must be connected to the ground potential (low impedance).

In Ex systems, the grounding is carried out according to the installation regulations.

With the Exd version, the minus side of the signal output is galvanically connected to ground via protective diodes. When connecting the instrument to a grounded PLC, equalising currents can flow in case of potential differences which can cause malfunctions. Make sure that there is sufficient potential equalisation from the system side or realise the connection via switching amplifier.

# 5.2 Connection procedure

Proceed as follows:

- 1. Unscrew the housing lid
- 2. Loosen compression nut of the cable gland and remove blind plug
- Remove approx. 10 cm (4 in) of the cable mantle (current output), strip approx. 1 cm (0.4 in) insulation from the ends of the individual wires
- 4. Insert the cable into the sensor through the cable entry
- 5. Lift the opening levers of the terminals with a screwdriver
- Insert the wire ends into the open terminals according to the wiring plan

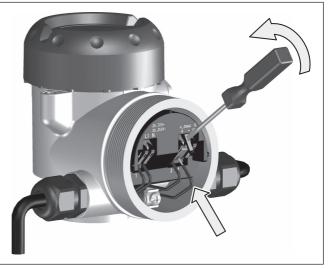

Fig. 15: Connection steps 5 and 6

7. Press down the opening levers of the terminals, you will hear the terminal spring closing

- 8. Check the hold of the wires in the terminals by lightly pulling on them
- 9. Connect the shielding to the internal ground terminal, connect the external ground terminal to potential equalisation
- 10. Tighten the compression nut of the cable entry gland. The seal ring must completely encircle the cable
- 11. Connect the lead cable for power supply in the same way according to the wiring plan, in addition connect the ground conductor to the inner ground terminal.
- 12. Screw the housing lid back on

The electrical connection is finished.

# 5.3 Wiring plan, double chamber housing

#### Housing overview

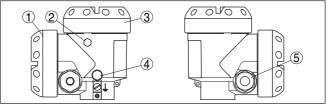

Fig. 16: Double chamber housing

- 1 Housing cover connection compartment
- 2 Blind plug
- 3 Housing cover electronics compartment
- 4 Filter element for air pressure compensation
- 5 Cable gland

#### **Electronics compartment**

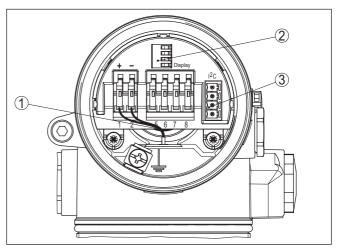

Fig. 17: Electronics compartment, double chamber housing

- 1 Internal connection cable to the connection compartment
- 2 Spring loaded terminals for display and adjustment module
- *3* Plug connector for service interface

#### **Connection compartment**

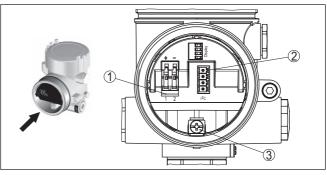

Fig. 18: Connection compartment, double chamber housing

- 1 Spring-loaded terminals for voltage supply
- 2 Plug connector for service interface
- 3 Ground terminal for connection of the cable screening

#### Wiring plan

Switch-on phase

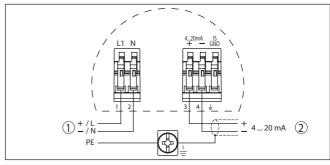

Fig. 19: Wiring plan - double chamber housing

- 1 Voltage supply
- 2 Signal output

# 5.4 Switch-on phase

After connecting OPTISOUND 3030 C to power supply or after a voltage recurrence, the instrument carries out a self-check for approx. 30 seconds:

- Internal check of the electronics
- Indication of the instrument type, the firmware as well as the sensor TAGs (sensor designation)
- Output signal jumps briefly (approx. 10 seconds) to the set fault current

Then the corresponding current is output to the cable (the value corresponds to the actual level as well as the settings already carried out, e.g. factory setting).

#### 6 Set up with the display and adjustment module

#### 6.1 Insert display and adjustment module

Mount/dismount display and adjustment module

The display and adjustment module can be inserted into the sensor and removed again at any time. It is not necessary to interrupt the voltage supply.

Proceed as follows:

- 1. Unscrew the housing lid
- 2. Place the display and adjustment module in the desired position on the electronics (you can choose any one of four different positions - each displaced by 90°)
- 3. Press the display and adjustment module onto the electronics and turn it to the right until it snaps in
- 4. Screw housing lid with inspection window tightly back on

Disassembly is carried out in reverse order.

The display and adjustment module is powered by the sensor, an additional connection is not necessary.

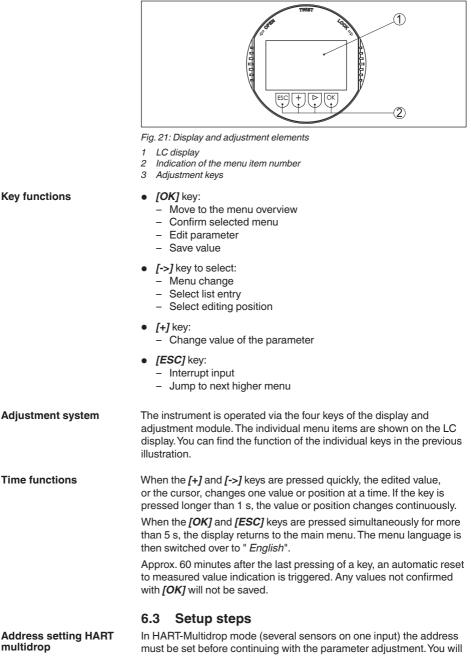

Fig. 20: Insert display and adjustment module

### Note:

If you intend to retrofit the instrument with a display and adjustment module for continuous measured value indication, a higher lid with an inspection glass is required.

# 6.2 Adjustment system

find a detailed description in the operating instructions manual of the " Display and adjustment module".

| HABT mode |

|           |

 Parameter adjustment
 The sensor measures the distance from the sensor to the medium surface. For indication of the real level, an allocation of the measured distance to the percentage height must be carried out.

The actual level is then calculated on the basis of these entered values. At the same time, the operating range of the sensor is limited from maximum range to the requested range.

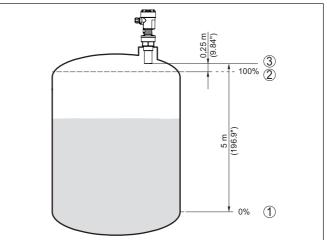

Fig. 22: Parameterisation example, Min./max. adjustment

- 1 Min. level = max. distance (depending on the sensor)
- 2 Max. level = min. distance (final value of the dead zone, depending on the sensor)
- 3 Reference plane

The actual product level during this adjustment is not important, because the min./max. adjustment is always carried out without changing the product level. These settings can be made ahead of time without the instrument having to be installed.

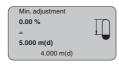

# Basic adjustment - Min. adjustment

Proceed as follows:

1. Move from the measured value display to the main menu by pushing [OK].

 Select the menu item "Basic adjustment" with [->] and confirm with [OK]. Now the menu item "Min. adjustment" is displayed.

- Prepare the % value for editing with [OK] and set the cursor to the requested position with [->]. Set the requested percentage value with [+] and save with [OK]. The cursor jumps now to the distance value.
- 4. Enter the distance value in m for empty vessel (e.g. distance from the sensor to the vessel bottom) corresponding to the percentage value.
- Save the settings with [OK] and move to "Max. adjustment" with [->].

# Basic adjustment - Max. adjustment

Proceed as follows:

- Prepare the % value for editing with [OK] and set the cursor to the requested position with [->]. Set the requested percentage value with [+] and save with [OK]. The cursor jumps now to the distance value.
- 2. Enter the appropriate distance value in m (corresponding to the percentage value) for the full vessel. Keep in mind that the max. level must lie below the dead band.
- 3. Save the settings with *[OK]* and move to "Medium selection" with *[->]*.

Basic adjustment - Medium Each product has different reflective properties. In addition, there are various interfering factors which have to be taken into account: agitated product surfaces and foam generation (with liquids); dust generation, material cones and echoes from the vessel wall (with solids). To adapt the sensor to these different conditions, you should first select "Liquid" or "Solid".

| $\left[ \right]$ | Medium |
|------------------|--------|
|                  | Liquid |
|                  |        |
|                  |        |

With solids, you can also choose between "Powder/Dust", "Granular/ Pellets" or "Ballast/Pebbels".

Through this additional selection, the sensor is adapted perfectly to the product and measurement reliability, particularly in products with poor reflective properties, is considerably increased.

Enter the requested parameters via the appropriate keys, save your settings and jump to the next menu item with the *[->]* key.

| Basic adjustment - Vessel<br>form           | Apart from the medium, the vessel shape can also influence the measurement. To adapt the sensor to these measuring conditions, this menu item offers different options depending on whether liquid or bulk solid is selected. With " <i>Liquids</i> " these are " <i>Storage tank</i> ", " <i>Stilling tube</i> ", " <i>Open vessel</i> " or " <i>Stirred vessel</i> ", with " <i>Solid</i> ", " <i>Silo</i> " or " <i>Bunker</i> ".  |
|---|---|
| Basic adjustment - Damp-<br>ing             | To suppress fluctuations in the measured value display, e. g. caused<br>by an agitated medium surface, a damping can be set. This time can<br>be between 0 and 999 seconds. Keep in mind that the reaction time of<br>the entire measurement will then be longer and the sensor will react<br>to measured value changes with a delay. In general, a period of a few<br>seconds is sufficient to smooth the measured value display.  |
|   | Damping<br>0 s<br>Enter the requested parameters via the appropriate keys, save your<br>settings and jump to the next menu item with the <i>[-&gt;]</i> key.  |
| Basic adjustment - Lin-<br>earization curve | A linearisation is necessary for all vessels in which the vessel volume does not increase linearly with the level - e.g. in a horizontal cylindrical or spherical tank - and the indication or output of the volume is required. Corresponding linearisation curves are preprogrammed for these vessels. They represent the correlation between the level percentage and vessel volume. By activating the appropriate curve, the volume percentage of the vessel is displayed correctly. If the volume should not be displayed in percent but e.g. in I or kg, a scaling can be also set in the menu item " <i>Display</i> ". |
| Basic adjustment - Sen-<br>sor TAG          | In this menu item you can enter an unambiguous designation for the<br>sensor, e.g. the measurement loop name or the tank or product des-<br>ignation. In digital systems and in the documentation of larger plants,<br>a singular designation should be entered for exact identification of<br>individual measuring points.   |

Sensor-TAG Sensor

With this menu item, the Basic adjustment is finished and you can now jump to the main menu with the *[ESC]* key.

# **Display - Indicated value** In the menu item " *Display*" you can define how the measured value should be presented on the display.

The following indication values are available:

- Height
- Distance
- Current
- Scaled
- Percent
- Lin. percent

The selection " *scaled*" opens the menu items " *Display unit*" and " *Scaling*". In " *Display unit*" there are the following options:

- Height
- Ground
- Flow
- Volume
- Without unit

Depending on selection, the different units are in turn available.

In the menu item " Scaling", the requested numerical value with decimal point is entered for 0 % and 100 % of the measured value.

There is the following relationship between the indication value in the menu " *Display*" and the adjustment unit in the menu " *Device settings*":

 Indication value " Distance": Presentation of the measured value in the selected adjustment unit, e.g. m(d).

| $\left[ \right]$ | Displayed value |
|------------------|-----------------|
|                  | Scaled ►        |
| L                |                 |
| ſ                | Display unit    |
|                  | Volume 🛏        |
|                  |                 |
| L                |                 |
| $\left( \right)$ | Scaling         |
|                  | 0 % = 0.0 l     |
|                  | 100 % = 100.0 l |
|                  |                 |

**Display - Backlight** A background lighting integrated by default can be adjusted via the adjustment menu. The function depends on the height of the supply voltage. See " Technical data/Voltage supply".

> To maintain the function of the device, the lighting is temporarily switched off if the power supply is insufficient.

| $\bigcap$ | Backlight |   |
|-----------|-----------|---|
|           |           |   |
|           |           |   |
|           |           |   |
| U         |           | , |

In the default setting, the lightning is switched off.

**Diagnosis - Peak value** The respective min. and max. measured values are saved in the sensor. The values are displayed in the menu item " Peak values".

- Min. and max. distance in m(d)
- Min. and max. temperature

reliability

Diagnosis - Measurement When non-contact level sensors are used, the measurement can be influenced by the respective process conditions. In this menu item, the measurement reliability of the level echo is displayed as a dB value. Measurement reliability equals signal strength minus noise. The higher the value, the more reliable the measurement. A well functioning measurement normally has a value > 10 dB.

The instrument status is displayed in this menu item. If no failure is **Diagnostics - Device** status detected by the sensor, " OK" will be displayed. If a failure is detected, there will be a sensor-specific flashing fault signal, for example " E013". The failure is also displayed in clear text, for example " No measured value available".

#### Information:

The fault message as well as the clear text indication are also carried out in the measured value display.

| Measurement reliability |
|-------------------------|
| Sensor status           |
|                         |

Diagnosis - Curve selection

With ultrasonic sensors, the "Echo curve" represents the signal strength of the echoes over the measuring range. The unit of signal strength is "dB". The signal strength enables the jusgement of the quality of the measurement.

The "False echo curve" displays the saved false echoes (see menu "Service") of the empty vessel as signal strength in "dB" over the measuring range.

30512-EN-210701

KROHNE

Up to 3000 measured values are recorded (depending on the sensor) when starting a "**Trend curve**". Then the values can be displayed on a time axis. The oldest measured values are always deleted.

In the menu item "Choose curve", the respective curve is selected.

| Curve sele | ction |  |
|------------|-------|--|
| Echo curve | •     |  |
|            |       |  |

### Information:

The trend recording is not activated when being shipped. It must be started by the user via the menu item "*Start trend curve*".

Diagnosis - Curve presentation A comparison of the echo curve and the false echo curve allows a more detailled evaluation of measurement reliability. The selected curve is updated continuously. With the **[OK]** key, a submenu with zoom functions is opened.

The following functions are available with "Echo and false echo curve":

- "X-Zoom": Zoom function for the meas. distance
- "Y-Zoom": 1, 2, 5 and 10x signal magnification in "dB"
- "Unzoom": Reset the presentation to the nominal measuring range without magnification

In the menu item "Trend curve" the following are available:

- "X-Zoom": Resolution
  - 1 minute
  - 1 hour
  - 1 day
- "Stop/Start": Interrupt a recording or start a new recording
- "Unzoom": Reset the resolution to minutes

As default setting, the recording pattern has 1 minute. With the adjustment software PACTware, this pattern can be also set to 1 hour or 1 day.

# Service - False signal suppression

High nozzles or vessel installations, such as e.g. struts or agitators as well as buildup and weld joints on the vessel walls, cause interfering reflections which can impair the measurement. A false echo storage detects and marks these false echoes, so that they are no longer taken into account for the level measurement. A false echo memory should be created with low level so that all potential interfering reflections will be detected.

False signal suppression Change now?

Proceed as follows:

- 1. Move from the measured value display to the main menu by pushing [OK].
- Select the menu item " Service" with [->] and confirm with [OK]. Now the menu item " False signal suppression" is displayed.
- Confirm " False signal suppression Change now" with [OK] and select in the below menu " Create new". Enter the actual distance from the sensor to the medium surface. All false signals in this area are detected by the sensor and saved after confirming with [OK].

#### Note:

Check the distance to the medium surface, because if an incorrect (too large) value is entered, the existing level will be saved as a false signal. The level would then no longer be detectable in this area.

Service - Extended setting The menu item "*Extended setting*" offers the possibility to optimise OPTISOUND 3030 C for applications in which the level changes very quickly. To do this, select the function "*Quick level change > 1 m/min.*".

Extended setting quick level change > 1 m/min.

### Note:

Since with the function "*Quick level change* > 1 *m/min.*" the generation of an average value of the signal processing is considerably reduced, false reflections by agitators or vessel installations can cause measured value fluctuations. A false signal suppression is thus recommended.

#### Service - Current output

In the menu item " *Current output*" you determine the behaviour of the current output during operation and in case of failure. The following options are available:

#### **Current output**

| Characteristics | 4 20 mA    |
|-----------------|------------|
|                 | 20 4 mA    |
| Failure mode 1) | Hold value |
|                 | 20.5 mA    |
|                 | 22 mA      |
|                 | < 3.6 mA   |

30512-EN-210701

<sup>1)</sup> Value of the current output in case of failure, e.g. if no valid measured value is delivered.

| Min. current 2) | 3.8 mA  |
|-----------------|---------|
|                 | 4 mA    |
| Max. current 3) | 20 mA   |
|                 | 20.5 mA |

The values in bold font represent the data of the factory setting.

In HART multidrop mode, the current is constantly 4 mA. This value does not change even in case of failure.

| Current output            |
|---------------------------|
| Characteristic: 4-20 mA 🕨 |
| Failure mode: 22 mA 🕨     |
| Min. current 3.8 mA ►     |

Service - Simulation In this menu item you simulate a user-defined level or pressure value via the current output. This allows you to test the signal path, e.g. through connected indicating instruments or the input card of the control system.

The following simulation variables are available:

- Percent
- Current
- Pressure (with pressure transmitters)
- Distance (with radar and guided radar (GWR))

With Profibus PA sensors, the selection of the simulated value is made via the "Channel" in the menu " *Basic adjustments*".

How to start the simulation:

- 1. Push [OK]
- Select the requested simulation variable with [->] and confirm with [OK].
- 3. Set the requested numerical value with [+] and [->].
- 4. Push [OK]

The simulation is now running, with 4 ... 20 mA/HART a current is output and with Profibus PA or Foundation Fieldbus a digital value.

How to interrupt the simulation:

→ Push [ESC]

#### Information:

The simulation is automatically terminated 10 minutes after the last pressing of a key.

| $\left[ \right]$ | Simulation        |
|------------------|-------------------|
|                  | Start simulation? |
|                  |                   |

- <sup>2)</sup> This value is not underrun during operation.
- <sup>3)</sup> This value is not exceeded during operation.

#### Service - Reset

If the function "Reset" is carried out, the sensor resets the values of the following menu items to the reset values (see table):<sup>4)</sup>

| Function                         | Reset value                                 |
|----------------------------------|---|
| Max. adjustment                  | Final value dead zone in m(d) <sup>5)</sup> |
| Min. adjustment                  | Meas. range end in m(d)6)                   |
| Medium                           | Liquid                                      |
| Vessel form                      | not known                                   |
| Damping                          | 0 s   |
| Linearisation                    | Linear                                      |
| Sensor-TAG                       | Sensor                                      |
| Displayed value                  | Distance                                    |
| Current output - characteristics | 4 20 mA                                     |
| Current output - max. current    | 20.5 mA                                     |
| Current output - min. current    | 3.8 mA                                      |
| Current output - failure         | < 3.6 mA                                    |
| Unit of measurement              | m(d)  |

The values of the following menu items are *not* reset to the reset values (see table) with "**Reset**":

| Function  | Reset value |
|-----------|-------------|
| Backlight | No reset    |
| Language  | No reset    |
| HART mode | No reset    |

#### Default setting

Like basic adjustment, but in addition, special parameters are reset to default values.  $^{\mbox{\tiny 7)}}$ 

#### Peak value indicator

The min. and max. distance and temperature values are reset to the actual value.

Service - Adjustment unit In this menu item you select the internal arithmetic unit of the sensor.

Unit of measurement

- <sup>4)</sup> Sensor-specific basic adjustment.
- <sup>5)</sup> Depending on the sensor type, see chapter "Technical data".
- <sup>6)</sup> Depending on the sensor type, see chapter "Technical data".
- <sup>7)</sup> Special parameters are parameters which are set customer-specifically on the service level with the adjustment software PACTware.

| Service - Language | The sensor is already set to the ordered national language. In this menu item you can change the language. The following languages are available as of software version 3.50:  Deutsch English Français Espanől Pycckuu Italiano Netherlands Japanese Chinese Language German  |
|--------------------|--|
| Service - SIL      | The functional safety is already activated Ex factory for instruments with SIL qualification. For instruments Ex factory without SIL qualification, the functional safety must be activated by the user for applications according to SIL via the indicating and adjustment module. The SIL factory setting cannot be deactivated by the user. |
|                    | The activation of SIL has the following impact:  |
|                    | <ul> <li>In the menu item "<i>Failure mode</i>" under "<i>Current output</i>", the parameters "<i>Hold value</i>" and "<i>20.5 mA</i>" are blocked</li> <li>In the menu item "<i>HART mode</i>", the function "<i>Multidrop</i>" is blocked</li> </ul>   |
| i                  | <b>Note:</b><br>For such applications, it is absolutely necessary to take note of " <i>Safety Manual</i> ".  |

Service - HART mode

The mode "standard" with the fixed address 0 means outputting the measured value as a 4 ... 20 mA signal.

In Multidrop mode, up to 15 sensors can be operated on one two-wire cable. An address between 1 and 15 must be assigned to each sensor.  $^{\rm 8)}$ 

In this menu item you determine the HART mode and enter the address for multidrop.

| $\left[ \right]$ | HART mode             |
|------------------|-----------------------|
|                  | Standard<br>Address 0 |

The default setting is standard with address 0.

HART offers standard and multidrop mode.

<sup>8)</sup> The 4 ... 20 mA signal of the sensor is switched off. The sensor uses a constant current of 4 mA. The measuring signal is transmitted exclusively as a digital HART signal.

| Service - Copy sensor | This function enables reading out parameter adjustment data as well  |
|-----------------------|--|
| data                  | as writing parameter adjustment data into the sensor via the display |
|                       | and adjustment module. A description of the function is available in |
|                       | the operating instructions manual "Display and adjustment module".   |

The following data are read out or written with this function:

- Measured value presentation
- Adjustment
- Medium
- Vessel form
- Damping
- Linearisation curve
- Sensor-TAG
- Displayed value
- Display unit
- Scaling
- Current output
- Unit of measurement
- Language

The following safety-relevant data are not read out or written:

- HART mode
- PIN

| _ |                   |

#### Service - PIN

In this menu item, the PIN is activated/deactivated permanently. Entering a 4-digit PIN protects the sensor data against unauthorized access and unintentional modifications. If the PIN is activated permanently, it can be deactivated temporarily (i.e. for approx. 60 min.) in any menu item. The instrument is delivered with the PIN set to 0000.

Only the following functions are permitted with activated PIN:

- · Select menu items and show data
- Read data from the sensor into the display and adjustment module

Info

### Info

# 6.5 Saving the parameterisation data

| On paper                                  | We recommended writing down the adjustment data, e.g. in this op-<br>erating instructions manual, and archiving them afterwards. They are<br>thus available for multiple use or service purposes.   |
|---|---|
| In the display and adjust-<br>ment module | If the instrument is equipped with a display and adjustment module,<br>the parameter adjustment data can be saved in it. The data remain<br>permanently stored there even if the sensor supply fails. The proce-<br>dure is described in menu item " <i>Copy sensor data</i> ". |

# 7 Maintenance and fault rectification

# 7.1 Maintenance

| Maintenance                           | If the device is used properly, no special maintenance is required in normal operation.  |
|---------------------------------------|--|
| Cleaning                              | The cleaning helps that the type label and markings on the instrument are visible.   |
|                                       | Take note of the following:  |
|                                       | • Use only cleaning agents which do not corrode the housings, type label and seals   |
|                                       | <ul> <li>Use only cleaning methods corresponding to the housing protec-<br/>tion rating</li> </ul>   |
|                                       | 7.2 Rectify faults   |
| Reaction when malfunc-<br>tion occurs | The operator of the system is responsible for taking suitable meas-<br>ures to rectify faults.   |
| Causes of malfunction                 | The device offers maximum reliability. Nevertheless, faults can occur during operation. These may be caused by the following, e.g.:                            |
|                                       | Sensor   |
|                                       | Process  |
|                                       | <ul><li>Voltage supply</li><li>Signal processing</li></ul>   |
|                                       | • Signal processing  |
| Fault rectification                   | The first measures to be taken are to check the output signal and evaluate fault messages via the display/adjustment module. The procedure is described below. |
| Check the 4 20 mA                     | Connect a multimeter in the suitable measuring range according to  |

# Check the 4 ... 20 mA signal

Connect a multimeter in the suitable measuring range according to the wiring plan. The following table describes possible errors in the current signal and helps to eliminate them:

| Error   | Cause   | Rectification  |
|---|---|--|
| 4 20 mA signal not stable                                   | Level fluctuations                                    | Set damping via the display and adjustment module  |
| 4 20 mA signal missing                                      | Electrical connection faulty                          | Check connection according to chapter "Connection steps"<br>and if necessary, correct according to chapter "Wiring plan" |
|   | Voltage supply missing                                | Check cables for breaks; repair if necessary   |
|   | Operating voltage too low or load resistance too high | Check, adapt if necessary  |
| Current signal<br>greater than 22 mA<br>or less than 3.6 mA | Electronics module in the<br>sensor defective         | Exchange the instrument or send it in for repair   |

In Ex applications, the regulations for the wiring of intrinsically safe circuits must be observed.

# Error messages via the display and adjustment module

| Error | Cause                                 | Rectification  |
|-------|---------------------------------------|--|
| E013  | no measured value available           | Sensor in boot phase   |
|       |                                       | Sensor does not find an echo, e.g. due to faulty installation or wrong parameter adjustment  |
| E017  | Adjustment span too small             | Carry out a fresh adjustment and increase the distance be-<br>tween min. and max. adjustment |
| E036  | no operable sensor software           | Carry out a software update or send instrument for repair                                    |
| E041  | Hardware error, electronics defective | Exchange the instrument or send it in for repair   |

### Reaction after fault rectification

Depending on the reason for the fault and the measures taken, the steps described in chapter " *Setup*" must be carried out again or must be checked for plausibility and completeness.

# 7.3 Exchanging the electronics module

If the electronics module is defective, it can be replaced by the user.

In Ex applications, only instruments and electronics modules with appropriate Ex approval may be used.

If there is no electronics module available on site, one can be ordered from the Krohne agency serving you.

# 7.4 How to proceed if a repair is necessary

If it is necessary to repair the instrument, please contact the responsible Krohne agency.

# 8 Dismount

# 8.1 Dismounting steps

Before dismounting, be aware of dangerous process conditions such as e.g. pressure in the vessel or pipeline, high temperatures, corrosive or toxic media etc.

Take note of chapters "*Mounting*" and "*Connecting to voltage supply*" and carry out the listed steps in reverse order.

# 8.2 Disposal

The device is made of recyclable materials. For this reason, it should be disposed of by a specialist recycling company. Observe the applicable national regulations.

# 9 Supplement

# 9.1 Technical data

### Note for approved instruments

The technical data in the respective safety instructions which are included in delivery are valid for approved instruments (e.g. with Ex approval). These data can differ from the data listed herein, for example regarding the process conditions or the voltage supply.

All approval documents can be downloaded from our homepage.

| Input variable                                   |  |
